INSTRUCTIONS

1. To secure adequate patent rights is an important purpose of this book. Only properly kept records will assure The Dow Chemical Company of such protection. When starting a project or experiment, write in precise language your purpose and general plan of procedure. Record your work as you progress, giving sufficient details. Handwrite directly in the book. Do not make notes on loose paper to be copied later.
2. All entries should be in permanent, black ink. Do not use pencil.
3. The subject or title of the experiment and the book number should be accurately recorded at the top of each page. The date should be recorded at the beginning of each day's work. Note all absences such as trips, vacation, illness, etc.
4. The various acts or experiments completing one or more projects may be recorded exactly chronologically, thus possibly mixing references to one subject with those to another, or space may be reserved for the complete recording of one experiment in one place over several days, as you prefer. If the latter course is adopted, indicate at the start of the next experiment how many pages were reserved for the one before it. Give a complete accurate account of what you did and what resulted. Enter all results good or bad. In case of error draw a line through the incorrect words. Then continue with the correct wording. Copious descriptions with elaborate details are preferable. Do not use private abbreviations or Company nicknames without frequently defining what they mean. Always keep in mind the necessity of original data to prove any new discoveries. If any portion of a page of more than two lines is left blank when that page is finally completed, draw a diagonal line through the space and write your initials and the date on the line. If it is necessary to insert graphs, etc., in the book, attach the insert along one edge only and use the page under it in the usual manner.
5. Names of witnesses who are present during the work should be recorded. Also the names of people with whom the work was discussed or to whom samples were given for analysis or testing. The dates of these acts should be recorded. It is also most desirable to keep a file of other papers relating to your work, e.g., analysis sheets, test request sheets, purchase orders, test results, etc.,. One or more scientifically trained witnesses should read and understand the pages covering each week's work and sign and date your book at least once a week. The witness form provided in the book every twenty pages also should be filled in. The witnesses must not be those who are co-discoverers with you of any of the work recorded.
6. New concepts, new solutions to problems and new ideas, plans or procedures and sketches should be recorded immediately in this book at the time they occur. When they are believed to be patentably important or when experiments show results of possible patentable importance, they should be disclosed to and understood by your co-workers. The best possible proof of your discovery is to have someone who is scientifically trained repeat the work and record it in his own book. Whenever possible, have one of your co-workers repeat your work and note this fact in your book. In particular, when an experiment shows results of possible patentable importance and especially when no witnesses were present, have someone else repeat the experiment as promptly as possible.
7. This notebook and all information recorded therein are the exclusive property of the Company. All contents are strictly confidential. You must take every precaution to safeguard this book against loss or damage by fire, water, etc.

Subjective response to Mescaline.

4/16/60

1

Date 4/16/60 Subject Mrs. Observer. Alfred.

DOSE 0.400 g. mescaline sulfate in water - preceded by 0.050 g. morphine one hour earlier. Slight bitter taste - but unpleasant.

CHRONOLOGY After 0.5 hrs. noticeable intoxication - 0.7 hrs first nausea successfully combated - at 1.3 hrs end of nausea - comfortable - slight speech difficulty - 1.5 hrs. first signs of movement and color distortion - 3.0 hrs. drug effect at maximum and remains there until 4.0 to 5.0 hrs. At 6.0 hrs - first noticeable signs of clarity from drug effects - at 8.0 hrs - only slight symptoms remain - essentially normal. Next day (24 hrs.) still occasional color intensifications but these are very difficult to objectively distinguish from normal responses.

HALLUCINATIONS Eyes open: - none - within the strict definition of a hallucination being a synthetic illusion or vision generated without recourse to real or tangible stimuli. There was certainly visual distortion, *q.v.*

Eyes closed: - world of motion and color - generation of α -centrally evolving clouds in intense color usually evolving from darker shades of blue and purple through green or red-green to lighter shades of pinks and reds. Also geometrical patterns, either in the form of colored wedges of light (usually passing from left to right) or in rectangularly symmetrical shapes, often with erotic suggestions. Phobic stimulation did not seem to be helpful. Towards the end of the drug's effect, occasional fields of color were noticeable, without appreciable motion or meaning.

VISUAL DISTORTION

In general very noticeable after the first 1/2 hrs to about 5.0 hrs. v.i.

→ DEPTH PERCEPTION

Distances between objects are incorrectly judged. In riding as a passenger in a car, the illusion that the buildings along-side the street, and the sidewalks, are crowding down on top of you, is remarkable. One tends to lean away from objects on either side, so as to try to compress yourself into a narrow space out of harm's way. Errors in judgement are on the conservative side so that danger is automatically avoided by an overly large margin. In viewing an abstract painting, the depths of paint applications becomes apparent (undoubtedly incorrectly) as if each color had been applied on a separate overlay of glass, and the entire picture assumes a three dimensional aspect that seems to expose the techniques of the artist. There is also a remarkable increase in textural and detail perception. Textures becomes rich in detail, and one can discern fine structural detail of nearly microscopic materials (apparently accurately, as verified by revisiting and reviewing objects seen). The veins of leaves and flowers are seen in revealing detail, without effort.

→ MOTION PERCEPTION

Very striking. Both inanimate and animate objects (although motionless) may be seen to be in rapid and continuous motion. It seems to be impossible to anticipate which objects will be seen next in motion. Peoples faces may seem to distort and crawl into different shapes. A person leaning upon a car will cause the car to be pushed rapidly into the ground. On closer inspection, the car which is rapidly descending into the ground is of course not moving, but

the wheels are rotating in a direction which resists the cars descent. This all seems real, continuous and logical. Watching the leaves of a plant from a distance, when the sun moves so as to fall upon them, they appear to raise themselves continuously towards the sun. As they fall into shade, their upwards motion is replaced with a down wards curling, continuous, as if to knot into a ball. Closer inspection shows that they have, of course, not knotted, but are actively knotting. The concept of continuous motion is not contradictory with the observation that after a prolonged period of observation, they are indeed in essentially the same position, but still knotting.

→ COLOR PERCEPTION Most striking. The slightest differences in shade may be (need not be) amplified to extreme contrast. Many subtle hues become nearly phosphorescent in intensity. Saturated colors are often unchanged, but are surrounded with cascades of new colors tumbling over the edges. Intensification in color, rather, the easily observed differences in shades, is a remarkable reward for driving or walking through the country.

→ TIME PERCEPTION Noticeable. Subjective time is lengthened. What seems like a half-hour of contemplation or observation occupies only perhaps five minutes. The radio seems to be lower pitched, and almost casual or indifferent in its content.

→ INTERPRETATION During the initial phase of intoxication (2-3 hrs) everything seemed to have an humorous interpretation. Peoples ~~faces~~ faces are in character; small ~~cars~~ cars seem to be chasing

4/18/60

larger cars - all the cars coming towards me seemed to have faces. One would seem to look like a dachshund, moving in regal pomp - another would be a widowed old man running away from someone.

PHYSICAL COORDINATION

There is apparently no great decrease in physical coordination. An attempt was made to drive the car (on a relatively untraveled road, Grangey, Pease, Blvd.) which was successful; except for an extreme conservatism and caution. In the event of a challenging situation (approaching car simultaneous with a horse-back rider on the right) the car was brought nearly to a stand-still to permit the insoluble problem resolve. The overall effort was unpleasant, as one was forced to withdraw from the effects of the drug (adrenalin?) and there is perhaps a 15-20 minute period afterwards required for the effectiveness to again take control. One prefers to observe, not participate in the surrounding world.

One occasion, while descending a rather steep path, I chose to reverse my direction, and executed a turn and climb, on loose and steep dirt, with completely ~~some~~ gopher ability. It would seem that in the event of necessary action or self-defense - one could and would muster nearly full coordination.

During the intoxication phase, there is some speech distortion (similar to alcohol). This effect seemed to last well into the recovery stage.

MENTAL COORDINATION.

Here there is a considerable distortion. Philosophical problems seem to admit simple and rather obvious solutions. One does not wish to dwell for long on any one concept, however. It is possible to discuss one's thoughts with the observer, but it seems that the observer is merely tolerating ~~or~~ your ideas, but does not follow your reasoning. It is preferable to consider them quietly. There was observed an extraordinary dissociation of mind and body. One can look out over the landscape and travel along the line of sight. The body takes care of itself as far as moving is concerned. To swing one's eyes around the horizon makes one giddy due to the rapid motion. The body seems incidental while the mind is borne on the line of sight, but the basic sympathy for it (detached) requires that you do not allow it to come to harm. Self-harm is a real possibility however, through inadvertent walking into hazardous areas. It also is very difficult to concentrate on outside conversations. One's own thoughts and observations are too extreme and important - one tends instead to stare at the speaker - his colors, expressions, details.

MENTAL ATTITUDE

One of the most startling effects of this drug is the extreme empathy felt for all small things - a stone, a flower, an insect. I believe that it would be impossible to harm any thing during the effect, and to commit an overt harmful or painful act upon anyone or any thing is beyond one's capabilities. One cannot pick a

4-18-60

flower - and even to walk upon a gravel path requires one to pick ~~his~~ his footing carefully to avoid hurting or disturbing the sands.

One tends to feel extremely suspicious in a larger group of people, although according to the observer, one's behavior is quite proper although a little cautious or reserved. As to mental motivation one is content to observe at length, to contemplate nature in detail, and so to be somewhat reclusive, withdrawn, and unsociable.

GENERAL COMMENTS

The overall effect is very pleasant - the desire is strong to repeat the experience on both smaller doses (to perhaps permit one to be alone in safety) and on larger doses. Also to repeat the experience under a variety of external stimuli - with music available for contemplation - at the beach - at night.

There is complete recall of all experiences and thoughts, after the drug has been dissipated.

The feeling of comfort, introspection, and tranquility that remains afterwards may indeed have an effect days after the treatment. One feels that this feeling may be prolonged and further enjoyed upon repeated usages. Such a change would be most desirable in many personalities - and may represent a therapeutic value for the drug in cases of anxiety and tension.

Here - eventually - basis of M.V. calculation - but for now a tally on M. use.

- 3/19/67 Boris - 400 mg - minor - took ^{MO} _{me} methuho (1) churo (1) ^{oth} _{oth} 2 hrs. earlier.

see page 2. no antiemetic administered.

SUBJECT

Gladys After a short period of nausea lasting from about 0.8 to 1.1 hrs after the administration of the drug, the subject seemed to be in a good mood. There was some tendency to over-appreciate an average joke. Coordination seemed essentially normal - able to work a problem accurately on a slide rule. At about 2 hrs. had to leave the laboratory to talk with a visitor briefly - experienced no insufficiencies in talking with him. At 2 1/2 hrs took a long walk (about a mile) and seemed to lack no coordination or ability to protect himself from traffic. Riding in a car evidenced some claustrophobia and loss of accurate distance estimation. At 3 1/2 hrs found listening to music extremely enjoyable and found he could lose himself completely in it. Would lie on the floor with his head under a blanket. Reported a euphoric association with it (eyes-closed hallucinations) but could talk to the other subjects voluntarily at any time. Made the statement "If I had a little more of this drug, I could have an orgasm to that music". (Stravinsky: Rites of Spring). Subsequent Chopin Piano Etudes and Bech Church Organ of music seemed equally pleasurable.

He would become very irritated at the conversation of others if he ~~was~~ wished to attend to the music. This vocalized request to "shut up or go into another room if you want to talk" was his only aggressive symptom.

Sub-acute human in vivo tests - TMA.

 dosages of Muscalin. Drugiveness comparable
 to from 2 to 3 times this ut. dose of Muscalin -
 indicating a pharmacological potency of 2-3 times.
 Observer comments - see page 9. 2 reg.

FOLDOUT BLANK

4/28/60

He had very little desire to eat, seemed to have very little mescaline-like color or motor synthesis. Left the subject at 5 hrs, at which time he was definitely withdrawing from the drug's effect. By his report there were essentially no remaining effects at 8 hrs, although he complained (as did his wife) that he was in a grouchy and irritable mood the next day.

His general impression was that his dosage was with a "drugged effect" equivalent to 300 or 350 mg of Mescaline but definitely not as much as 400 mg. (i.e. 2-2½ times the potency of Mescaline). When asked if he would like to repeat the experience he seemed indifferent, saying that it was interesting but he preferred mescaline.

SUBJECT

Hugh There was very nearly no nausea response of this subject to his nearly-equal dose of the drug. (Subject is exceptionally sensitive to the emetic effect of mescaline). At 1½ hrs experimented with the phosce stimulator, generating (eyes-closed) patterns of palm-leaves and swaying trees. Became somewhat talkative, fell into a role of joke-telling (somewhat poor jokes, which he told very well, however). He seemed a little light-headed, and responded in an unusually out-going manner to questions.

During the 1-mile walk he was quite aware of the mescaline-like perception of detail and commented on his (presumed) ability to sit and philosophize upon the behavior of birds (he is a bird-watcher). He felt that he would be able to remember ~~these~~ their behavior because he could correlate it to his own, and thus better

understand it. He was struck with his capacity to observe his own personality objectively, and found the various components of it to be separately analyzable.

At 3½ hrs. (during the music experiment) he became extremely (and annoyingly) talkative. He would discuss the origins of languages, how they are derived from the environmental needs of the people, and that perhaps languages of unknown origin could be traced by correlating basic words or word-stems; and the geographical terrain requirements. And many more such philological meanderings.

He would occasionally fall into a deep reverie, from which he would emerge full of conversation, talk for a while intensely - then retreat to his thoughts. There was no impairment of mobility - he would wander around the room. During the music, he lay on the floor and kept his eyes fixed on the ceiling (a tuxedo-textured surface) and found interwoven ~~with~~ motion in it.

Repeatedly his self-description would return to the fact that his personality was divided and exposed, that he felt he could understand his psychic structure most clearly. He commented that the psychiatric use of the drug would be interesting to persons.

At 5 hrs., accompanied the subject back to his car, and at 5½ hrs, he felt capable of driving to San Francisco. He had no assignable aftereffects except for a slight stomach-ache the following day. No grouchiness.

His general impression was that the drug was most completely pleasant, as it

Continued from page 9.

4-28-60

allowed him to intimate a view of himself. He would try the drug again only for a specific reason. However, it did reiterate his opinion that it had value in psychiatry.

SUBJECT Irving

There was no nausea experienced after taking the drug. Subject had, initially, with mescaline, moderately severe nausea, which decreased on each subsequent trial. At about 1 1/2 hrs he got quite happy, appreciating the current joke telling more than it deserved. The 1 mile walk seemed to fatigue him, but there was no apparent physical lack of coordination. Of the three subjects, he seemed to show the least drugged effect. The car ride evoked no unusual comment or action.

While the music was in effect, he chose to quietly lie down and observe the stroboscope, in which he believed, but was not sure, he saw shapes and patterns. He seemed to be ~~more~~ more interested in my reaction to his reactions, and did not choose to ignore my presence.

I left him at the 4 hour point, at which time he seemed to be withdrawing from what few symptoms he ever had.

The following day, there was no report of any after-effect, and, his general ~~memory~~ memory was of an extremely light effect from the drug. He was indifferent concerning a re-trial of the drug, felt that the little effect it had didn't warrant wasting a day.

SUBJECT

Subjective response to TMA.

DATE 9/16/60

Date May 14, 1960 Subject AT5 Observer Alfred Gladys

DOSE 225 mg TMA-HCl in water (alcohol bitter taste)
0.050 mg Marezine 1 hr. before

CHRONOLOGY. At 0.8 hrs. moderately severe nausea - can be repressed - fades out at 1.3 hrs. at 1.5 hrs first awareness of mescaline-like effects build up slowly to 2 1/2 hrs - start of intensive aggression - 3.0 hrs back down to mescaline effects with only occasional lapses of the intense type feeling - at 7 hrs mental effects essentially gone - able to drive a car rationally.

HALUCINATIONS eyes open none eyes closed mild shape-generation and color motion synthesis -- much less than with an effective dosage of mescaline.

VISUAL DISTORTION In general, very dependant upon the chronological elapsed time. During the bulk of the experiment, some channeling - varying to a wall-to-wall near blindness at the short-duration extreme of the drug. see below.

→ Depth perception: During the short duration of the extreme effect of the drug, the range of vision seemed to close in. Probably things at a distance were ~~not~~ visible but did not register on the conscious mind. One kept wanting to swing ones hands out and around to keep complete submersion from occurring. This corresponds in time with, and is undoubtedly responsible for part of, the extreme aggressive response discussed below.

9/16/60

- Motion Perception - very slight - some crawling of textured surfaces - similar again to mescaline.
- Color perception - slight. at nearly the most intense portion (building up to it) hamburgers were being made (no desire what-so-ever to eat) and the catsoup had an intense red, 3 dimensional blood appearance. This was certainly in part a reflexion of the murderous mood that was developing. Withdrew from the area quite voluntarily.
- Time perception: Time was slowed in proportion to the intensity of the other effects. During the $\frac{1}{2}$ hr of intense effect, it seemed like many hours.
- Interpretation: Nothing noticeably new. Auditory interpretation very interesting - see under mental attitude

PHYSICAL COORDINATION

There is some speech difficulties - but very little patience with these limitations. Slight rubberiness in muscles - attempts at vigorous exertion during the ~~the~~ intense effects of the drug were ^{and after} unduly, were more tiring than usual. Also - there did not appear to be any exceptional strength. Swung a heavy stick against a tree - the spirit was willing but the flesh weak. Minor teeth chattering.

MENTAL COORDINATION

The mind is frantically active; one is very impatient with the inability to speak easily and quickly ones ideas. One is completely aware that the effects are due to the drug, but the effects are real and cannot be ignored. Every word and motion is rapidly evaluated, and remains usually unuttered, due to concentration and time required. Response to a direct question is possible, but the suspicions are present as to the secondary motives behind the question.

MENTAL ATTITUDE

Herein lies the schizophrenic effect of the drug. During the early period of the drug effect, after the nausea, I sat at the dinner table and read Bernstein's Song of Music. To me, every phrase was audible to me, and I found the book exceedingly pleasurable. According to an observer (Alfred) I was pugnacious about the music, (the book), and insisted that one had to have either a knowledge of music theory, or the drug, to appreciate the work. Also - I insisted that Bernstein had had the drug when he wrote the book (condemnation of him musically?).

At about 2 hrs. I listened to music from the radio. Rachmaninoff's 2nd piano concerto was playing (with which I am quite familiar!) I curled up under a blanket in front of the radio (assumed to be embryonic form of  with

9/16/60

head more or less down between legs. The feelings in this exceedingly pleasant period are very difficult to describe. I was associated intimately with the structure of the music. With my eyes closed, I was suspended, inverted, held by the fine filigree of ~~of~~ the music, in a comfortable, prenatal? chamber. The vigorous scales & ~~the~~ arpeggios of the first movement were the chords that supported me from overhead. It was beautiful. After what seemed like an eternity, the movement ended, and I rejoined my observers, and attempted to describe the impressions. The 2nd movement started, and I retreated under the card table, lost again in the piano concerto.

After this piece there was a period of commercials, that set me into a very aggressive state (unfortunate in light of subsequent involvements). I was irritated with the ~~cessation~~ cessation of music. The next selection was "Slaughter on 5th Avenue" (most, most, unfortunate). It was from this musical selection that I emerged in the extreme psychological state of violence.

For the next 1/2 hr. (objective) (subjectively it seemed without end) the violence of action seemed to be the only way of life. (N.S.) mentioned that she had seen many people walking down the street with the same, intense, anti-cross-me-if-you-know-what's-good-for-you-attitude on their faces. Apparently my dinner was murderous: no observer would object to any thing that I said or cross ~~with~~ any decision of mine.

9/16/60

It was in this period that I was asked by an observer (Gladys) if I could see in it even the same mescaline-like colors and textures that I was familiar with. I recognized the similarities. He then asked if I could hurt the flower. Without hesitation I took the blossom and crushed it in my fist, an act that would be normally most difficult to do, and which under mescaline would be impossible absolutely impossible to do.

At one point Gladys asked me if I thought that I might do well with a tranquilizer (he subsequently admitted that he was concerned as to the extent of my subjugation to the drug) and my response was a veiled threat to push him down the stairs if he tried to "medicate" me. He did not pursue the subject.

After the intensity of this reaction had subsided, (Gladys) suggested a ride in the car, and my comment was that "it should be safe, there is a great deal of steel to protect people from me." We went into the ~~to~~ eucalyptus grove behind the Botanical gardens at Cal. It was there that I tried swinging a big stick. (D.E) I picked up a stone, and mentioned that I could, without hesitation, scratch a gouge in his fender. He inquired why I didn't, and I admitted that I recognized that I would, the next day, have to pay for the damages. It was this reality-awareness that stayed my hand. But I could easily see how another person without this heavily wired social consciousness, could easily

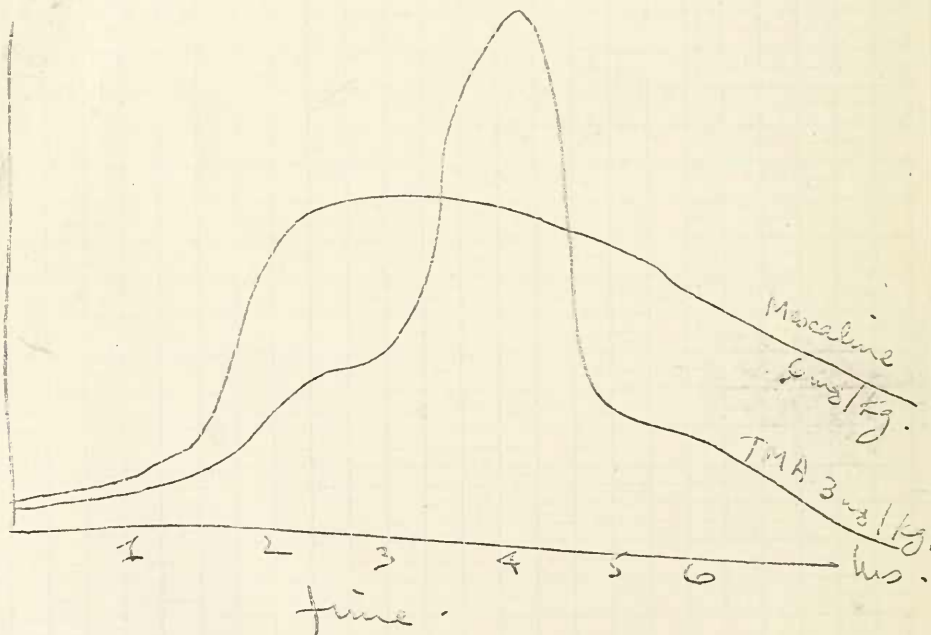

9/16/60

for a vandal. At this point, I had already passed the maximum of the drug, and I could reason in this manner. If I had been confronted with the same situation an hour earlier, I may very well have scraped a nasty gash in his fender.

GENERAL COMMENTS:

This drug - to an extent, approximated mescaline in its effects. Try to compare by a graph:

effect of
any sort.

The idea attempted to be foreshadowed is that in almost every comparison, TMA was similar to mescaline, but comparable to a smaller dosage. BUT; in the middle of this some what ~~is~~ ~~is~~ uninteresting.

SUBJECT

DATE

Continued from page 13

9/16/60 -

experiments there emerged an unexpected effect that was alien to mescaline.

No observer can be objective. I do not know if these effects are the result of the drug -

1) creating an image of an aggressive neurotic in me; and my response can be blamed on an inherent propensity of the drug; or

2) the drug released a natural, but repressed, facet of my personality; and with another subject the quality of the response would be completely changed.

These problems can be resolved only with much more extensive experimentation.

DL-TMA has subsequently been employed, primarily under the eye of Hugh, in dose levels of 2.8 to 3.5 mg/kg on five assorted subjects. Without exception there was a thorough response, summarized in the Nature paper - him & Gladys

Sub-acute oral effects - AEM.

3/5/61

| Date | Dose (mg) | Dose (mg/kg) | Observations |
|---------|-----------|---------------|---|
| 3/5/61 | 150 (sub) | (.002 mg/kg) | no effect. |
| 3/7/61 | 1 mg | (.011 mg/kg) | no effect. |
| 3/31/61 | 2.4 mg | (0.027 mg/kg) | (HAM) distinct taste - no effect. |
| | 6.5 mg | (0.073 mg/kg) | 240pn. Bitter
taste up to 22 afferent. no effect. |
| 4/1/61 | 9.1 mg | (0.1 mg/kg) | nothing |
| 4/3/61 | 13.1 mg | (0.15 mg/kg) | some tremors? - able to concentrate
possible muscular effects?
no effect. |
| 4/6/61 | 18.5 mg | (0.21 mg/kg) | negligible effect. |
| 4/13/61 | 30.5 mg | (0.35 mg/kg) | " " |
| 4/20/61 | 49 mg | (0.56 mg/kg) | " " |
| 4/26/61 | 80 mg | (0.91 mg/kg) | " " |
| 5/10/61 | 123 mg | (1.4 mg/kg) | no effect. |
| 5/19/61 | 178 mg | (2.0 mg/kg) | no effect |

at this level TMA would be really effective - there is no nausea - no real muscular effect - certainly no mental effect. conclusion - AEM less active than TMA.

Subsequently. (~ Dec) took, orally 220 mg (~2.5 mg/kg) - no assignable effect
Unless further evidence comes into play, this is all.

Doctor Sasha Shulgin
Dow Chemical Company
Walnut Creek, Calif.

2 trials

Dear Sasha:

JAY & myself tried the MMDA on Sunday, 26 of August.
Our log follows: (taken by KAREN up to 11:30)

- 10:24 100 mg orally
- 10:55 felt reaction, saw slight green tinge in shadows of faces. Pupillary dilatation CC. No dilatation for W. L., but he felt "layback."
- 11:05 Volluble, constant movement of hands & feet (as per usual for me) W. L. experienced the "floats."
- 11:10 CC felt warmth & muscle "tone" (almost quivering)
- 11:30 Departed for Marin country with LOU (originator of (TEXVOR)) Shopped in supermarket at about 0.8g.
- 12:30 Arrived at home of MARTY and NANCY (Magnificent oriental stage in living room.)
- 1:00 Picnic with no effect on taste. Still .8g, very pleasant
- 2:00 Experience comparable to 20 MG LSD 25.
- 2:30 Feeling relaxed, composed
- 3:00 Back to normal; feeling of having taken amphetamine.
- 3:30 Returned home; approx. .9g.
- 4:30 Slight feeling of "green apples" in stomach
- 9:00 Eyes still dialated; a little restless but slightly tired
- 11:00 To sleep. Slept well. Awoke refreshed and happy.

Look forward to your meeting Odessa
Regards

IRVING

REPORT OF SUBJECTIVE

Observations on Psychoactive Effects of Methoxy Methylene Dioxy
Amphetamine

IRVING

11:20 a.m., Saturday, September 1, 1962 - 210 mg. MDMA orally

100 kg → 1.8 mg/kg as free base

MDMA tastes awful. The bitter alkaloid taste is followed by a distinctly chemical laboratory flavor as if from old rubber tubing. This is easily dissipated by a drink of fruit juice and cookies. Nothing seems to happen for about 45 minutes when rather suddenly an anvil seems to lower itself over your head; you feel disoriented, and tend to withdraw from social contact a little. In an hour you feel like wandering off into the hills to be alone. This drug gives less feeling of being ill than mescaline. The effect definitely reaches a climax with a pleasant afterglow following. Apparently there is no profound motor coordination problem. Although I didn't feel too steady, I could run down hill at full speed without falling. Would probably have trouble juggling though.

200 mg. MDMA yields that "Sunday afternoon" feeling of desiring to lie down and enjoy life; a luxurious feeling of "layback."

No enhancement of colors in visual scene (except some greenish tinge in faces) but on closing eyes hallucinations appear to be quite real in 3-D; like watching a movie. First these dreams appear in black and white but later color starts appearing. Chartreuse and magenta first appear, then blue and finally red. First had visions

(Continued on page 2)

by phone - had said "in 30-45 min, Anvil over head"

of large numbers on gaming tables, than people. MDMA appears to bring dreams to the conscious level; is a link between the sub-conscious and the conscious.

There is a desire to lie down and sunbathe. One must be hot for he perspires profusely lying in the sun but he doesn't feel the heat - just a comfortable warm feeling inside; languorous and at peace with the world. The drug induces a profound feeling of relaxation. Visual hallucinations with eyes closed are vivid, colorful, 3D and appear quite real. One tends to be somewhat anti-social or maybe more pro-nature, enjoying the open air, fields and trees more than being in a crowd.

Commentary on tape during experience:

"I've never had a drug affect me like this. I'd have sworn it were opium if I didn't know it were illegal. The colors I got were magenta, fuscia and chartreuse, mainly. Then I began to get some of the reds at about 12:45. Then marvelous visions filled with little translucent spheres of chartreuse, blue, gold, yellow and red, which cascaded down a glass stairway in waves like brightly multicolored marbles. There is a feeling of consciousness yet ^{not} really being here in the world. I don't remember the things that happened just a short time ago. Slowly, the whole thing has been building up of fleeting visions. The big tendency is simply to lie back, not necessarily to go to sleep, but to relax completely out in the sun and just to

(Continued on page 3)

enjoy this feeling of luxurious lazor. "I am prone to be prone." I feel just a little bit incoherent, possibly slightly ataxic. Here, I just lie out in the sun; I've never been so completely relaxed by anything before. This is a fine way to sidestep worries and just enjoy life. At times I have feelings of lucidity and contact with the world and I can wander around, up and down the hillside, among the fields and trees with no problems at all. But then a little later I want to get away from people and just lie down with my thoughts and visions. There are no feelings about feelings. The euphoric state comes in waves like a great prolonged orgasm. When the drug effects start wearing off, one feels what might best be described in the marriage manuals as the "afterglow."

I think 200 mg is an excellent dose. Here I drop in on my sub-conscious without going to sleep altogether. There is a little feeling of depersonalization. Earlier in the day I felt my legs and feet were detached from my body when I nodded my head from side to side; an illusion somewhat akin to the Pulfrich effect causing the lighted end of a cigarette ^{to} appear to detach itself from the body of the cigarette when waved in a semi-darkened room.

Just now on closing my eyes, I am able to see some very brilliant regal purple velvet encrusted with silver broaches on an ermine white background. The scene changes to a rich golden effulgent light pervading everything when I turn with eyes closed towards the sun. However, on shading the eyes, the whole scene becomes drenched in brilliant blue. A feeling of warmth and gregariousness pervaded me as the drug began to wear off. It was most pleasant to be with

(Continued on page 4)

BOOK NO.

people and to communicate to them the feelings and visions I had recently experienced. Paul lost his memory for names temporarily. Heads cleared around 4:00 p.m.

This drug should sell as a relaxant and euphoriant. The psychoanalysts should be able to make good use of it if in fact it proves to be, as it seemed to me, a conscious link with the subconscious. It seems dreams are experienced while being awake and very real appearing scenes flit by as if in the movies. I have never felt so profoundly relaxed. Felt fine the next day. Slept ten hours and felt relaxed and refreshed on awakening.

QUIN

MMDA / MINIATURE HIGH

Quin

I believe 2.3 mg/kg.

I use the word miniature in the sense that I would describe a piece by the jazz pianist Bud Powell as a miniature.

Comparing a Beethoven piano sonata with Autumn in New York as played by Powell would be analogous to comparing ~~MMDA~~ ^{mescaline} and ~~Mescaline~~ ^{MMDA}. MMDA comes through as a miniature high -- everything is there but in lesser quantity and duration.

MMDA stops barely short of the Olympian Universe of time-ceasing and ^{the assurance of} organic and inorganic radiance. The immediate part of the high is about two and one half hours in duration. Rather than a cessation of time, as there is with mescaline or psilocybin, there is a kind of timelessness during the first maleiselike hour of the high. There is more ~~of a~~ feeling of stupefaction than there is with most highs.

In a car climbing the Berkeley foothills I went into a terrible fear. ~~At the second worst I've had.~~ It only lasted a few minutes -- but it did not matter in the timelessness how long the panic lasted, it was eternal. I looked out onto the grassy hillside at the dead silver-brown grass. In the expanse of field I could see each separate blade of grass gleaming ~~with~~ and the

trillions of brown-silver blades blended together into a vast wavering fur. Far below was the panorama of foggy Berkeley and Oakland and the bay. --It all began to loom in timelessness and beauty. --I thought I was going to enter the Olympian Universe. I WAS NOT PREPARED FOR THE OLYMPIAN UNIVERSE! --I had been expecting something like marijuana. I realized that if I entered the Olympian that I hadn't yet recovered sufficiently from my last high to hold myself together.

Heat swelled in my genitals and rose to my stomach. --I felt ~~an~~ agonizing ~~and~~ ~~terrible~~ fear. I wanted to ask the others to go back so I could take thorazine. I couldn't talk. The car swerved around a hair-in bend in the road giving me another view of the silverbrown grass-fur and the vast unwanted dearness of the view.

Suddenly I was fighting with 'Captain Zero' -- I mean the whole disordered and eternity-seeking consciousness that is no longer mammalian in nature but belongs to the order of molecules and inert matter! I decided that all I could do was to go with it -- to let zero take over, but then I was sure that I would not come back. ~~When~~ I tried to hold back the high but ~~I~~ realized I would do myself damage that way. Then I tried to get on top of the whole high and control it. All in all, I tried perhaps fifteen or twenty ~~unrecalable~~ ^{almost} ~~and~~ ^{almost} undecribable means to ~~either~~ control or escape the high.

--^{Darning} ~~Darning~~ this time I believed that I was going to pieces and I would possibly never be with the human-world again. My insides were going wild and my conscious mind seemed to be the only force holding me together. At one point I managed to ask

how the dosage had been figured. --I was reassured by comparing the dosage to masculine dosage. for a moment I grasped the fact that I could go through three hours of the fear. then my insides and mind went wilder. Jesus, I could not enter Olymnia again!!

When the car started I was in control and the aroused molecular consciousness had dissipated. the number of exits and ~~exits~~ ordinary animal powers that I ~~had~~ tried had given me control. I account the sudden gaining of sureness to ~~wide~~ experience with ~~hallucinations~~ hallucinogens. I don't think any of the methods that I tried worked -- but the number of possibilities gave me an assurance that I could control me even in Olymnia.

I told the others what had happened ~~and~~ and felt I could enjoy some of the day. *for a moment I felt the joy of life*

(Interestingly, none of the other participants got to the Olympian Universe during the high. I account the fact that I touched ~~the borders of reality~~ *the borders of reality I have had* ~~the borders of reality~~ *the borders of reality*

2. ...

peyote and psilocybin.

As we walked up the fo'rtath over golden brown dust I saw ~~xxxx~~ footprints of birds, tennis shoes, and bare feet. The frightening nature of tracks and artifacts began to ~~xxxx~~ overwhelm me. As I walked I tried to insulate myself from the sight. To my right was the dream panorama of hundreds of square miles of enchanted cities and dream-reality fog pouring upon them from the bay. I was not interested and only cared about keeping myself together and not slipping back to meet Captain Zero.

The short, eternal, uphill walk exhausted us and we fell on the ground in a tiny stand of trees. I still wanted the ex-

perience to end and to return to the meanings of daily loves and realities. ~~But~~ I had adjusted enough to make it through the high. My companions closed their eyes and began having brain movies. (Earlier ^{my eyes} ~~my eyes~~ had been forced shut many times by the anabolic hallucinogen pleasure.) Now I hid my eyes open not wanting brain movies or visions. When I closed my eyes experimentally I saw only glorious and pleasing blackness.

We talked desultorily and dozelessly and I realized that I was able to see through the eyes of my companions. They were seeing stark reality exactly as I saw it. I wanted to talk to ~~FREDO~~ and find out ~~what he was like~~ ^{what he was like} ~~but~~ I found talking too difficult. My eyes were beginning to close again with exhaustion and pleasure.

When I lit cigarettes I could not find my lips well and they were numbed. Matches kept blowing out in a wind that was not strong enough to blow them out. We wobbled when we walked.

We stayed in the little stand of trees. I sat for a while then got up and sat in another place. Then I got up again & etc.

Except for visual sensation, which was just on the verge of mesaling or psilocy in vision in clarity, I seemed to be sealed from sensation and living in a kind of hyper-lucidity of sense -- a pleasant paradox.

I lay back and closed my eyes and practised raising the goddess Kundalini (the Serpent Power) from the base chakra ~~and~~ through my body. I ~~XXXXXXXXXXXXXXXXXXXX~~ succeeded in raising the power, for the first time, past my shoulders and into my head. I realized, as I did it, that I was not truly raising the ~~X~~ Serpent Power but rather cleaning the nerve tubes. However, I achieved

SUBJECT

DATE

grayish-clear affective pictures of the chakra nerve centers.

It was a good feeling.

The crystal clear air gave bright green sharpness to the evergreens. Looking at trees of leaves or plants was like a mild mescoline high. Fir trees became living, green, modern sculptures of strange Indian rococo beasts -- as if the sculptor Linschitz worked at their trimming.

~~with~~ The malais-like feeling began to end and the doze-like feeling ~~with~~ with it.

I walked to a redwood cove where other members of the party were sitting. I was struck by the absolute and superb ~~xxxx~~ beauty and clarity of the people and the trees and air and the music that played over the portable radio. I felt close to the children and admired their beauty. At this point I realized that I was simply sitting and enjoying a Sunday noon ~~xxx~~ in its full pleasantness. Ordinarily I would have been bored with out more to do. The next couple of hours became a pleasant and beautiful picnic. The come-down was abrupt but not unpleasant. Time passed with swift rapidity for the rest of the day. Two hour periods would flash by. Late that night I was kept from sleep for half an hour by brain movies -- little crocodiles running across dusty roads through spotlights in the darkness, magic evergreen trees fading into and out of ~~xxxxxx~~ reality, and ~~xxxxxxxx~~ anecdotal sequences of brain visions.

BOOK NO.

AN OBSCURE FOOTNOTE

A week after taking MDMA I woke in the middle of the night and as I awakened I felt that there would be no reality but only nothingness. I was horrified and threw myself bolt upright in bed and opened my eyes instantaneously.

Shelley says:

Lift not the painted veil which those who live
 Call Life; though unreal shapes be pictured there,
 And ~~they~~^{it} but mimic all we would believe
 With colors idly spread, behind, lurk Fear
 And Hope, twin Destinies, who ever weave
 Their shadows, oer the chasm, sightless and drear. . .

The awakening I had was definitely a reaction to the MDMA. Yesterday I talked with a man who has taken too much lsd. I tried to avoid speaking of hallucinogens but he was insistent. As I described some post-hallucinogen states of extreme anxiety regarding the nature of reality the man began to writhe in his chair, wring his hands, and ~~lost~~^{lost} the ability to speak. ~~He~~^{He} I have been in that state. While speaking with Ra he identified it as an anxiety state and pointed out that it is not only related to hallucinogens but is a not uncommon anxiety state for those who haven't had drugs.

Ra accounts the state to an arising of ~~an~~⁴⁸ conscious material to the surface.

that seems fine and true enough -- as good a name for what is happening as any other. What it does not clear up is the intuitions that I have that strengthen and contradict each other. I am aware of two feelings: That the 'material' is of a repressed psychological nature in the Freudian-Reichian sense, and that there is also another order of 'material' confronted. The other order is that of the molecular level of consciousness. I mean a part of ourselves more related to the philosophical ~~xxxxxxxx~~ consciousness of sea urchins and sponges -- who are no more than the tugs of their desires and hungers and the consciousnesses of their motions and withdrawals -- who are an actual conscious part of the physical universe and the actual being of their proclama in the 'Surge of Life.' It would be interesting if what we so surely call the ~~Subconscious~~ or 'Unconscious' were in reality two or more vastly divided parts of our being that are both commonly inaccessible.

I am not saying this to strengthen my argument that I confronted the molecular consciousness on EMD. I was in too much of a fear state to be definite of anything when I think of it now two weeks later.

-- But I am intuitively ~~xxxxxxxx~~ sure that we are meeting two unknown areas -- both repressions and a ~~xxxxxxxx~~ molecular-philosophical-Universeconsciousness. I have a strong feeling that the second of these should be left untouched by both psychiatry and happy-day investigations. We mess with some structure that should remain unknown ^{because it is known by being.} -- Unless the experimenter is aware of the risk -- or ~~goes~~ ^{goes} slowly in an investigatory manner with ~~the~~ caution.

DMMDA.

'10/19/62

Date Sept 25, 1962 Subject ATS Observer - A.C., A.R., A.P.

Dose 183 mg (0.2 mg/Kg) (6:50 AM).

At 0.5 hrs drove to Pittsburg - no indication of nausea or any peripheral symptoms. Aided SVE in a distillation - seemed to gradually become intoxicated. 1.5 to 2.5 hrs. talked with AP, TERI, SVE, others - distinctly wound up and intoxicated. 2.5 to 3.0 hrs. spend in driving back to Walnut Creek. Wild drive. Feeling of speed of car not accurate - would observe mountain motion, overlay of scenery as my car's elevation changed - philosophized on ~~all~~ relative motion (advancement, retreat, ascent, decline,) completely dependent on motion of observer as well. Then I would think to watch the road again. etc. From 3.0 to 4.5 hrs. this high period persisted. My actions must have been noticeable but none commented. During period 4.5 - 5.0 there was a noticeable drop off of intoxication and was able to play a very acceptable game of bridge 5 - 5.5 hrs. The knowledge of "not-being-me" lasted on, however, and at 9. hrs I drove home. This drive was still a little detached and unreal, but was nevertheless under control. A martini at 11. hrs. completed the wash out - no after effects, no sleep problems.

This is a marginally active dosage of what may be quite a CNS or psychotomimetic drug. Must approach higher dosages with caution.

I have read pages 22 to 28 in this notebook and understand their contents. There are no blank pages, except ----- All entries are in the handwriting of -----

Date. Nov. 15, 1962 Subject MS - Observer AO

Dose 24.7mg (0.3mg/Kg) 7:17 AM. All times corrected to this. I shall transcribe my notes taken throughout the experiment, as far as they are legible. Comments are added in [].

Time. Remarks:

- 8:15 Intoxication hit - very very like LSD eyes 30% dilated [there was absolutely no preliminary warning in the form of nausea]
- 1:45 Shaky - leg problem [knees a little weak] not much more intoxicated - eyes 50% dilated.
- 1:55 Into load - mild depersonalization (as if LSD) - took crap, wiped - saws really scary - eyes closed - slight early - muscaline clouds - no color [this was last vomiting in nearly 4 hrs - cannot recall amount voided]
- 2:00 Time seems slightly slowed - warm feeling in genitals - may yet be nauseated [handwriting deteriorating]. Tried to proof-read a couple of papers - wow [actually did an excellent job]
- 2:05 teeth rubbery - legs a bit ataxic (very mild) still feel a little wobbly.
- 2:10 talk a little garbled - taste in throat of something eaten a couple of hours ago (nothing) - slight nausea.
- 2:15 arm ataxia now [handwriting quite bad].
- 2:15 good to drink now - no motion no color.
- 2:20 Time subjectively slowed - feel that several people have become aware - AO assesses me not so pulse 92 [felt guilty being in back of lab looking at clock for such a long 15 seconds - felt certain I was conspicuous]. I am certainly as intoxicated as under 80ug LSD.
- 2:35 suspect AQ knows [he didn't, when I confided in him later] AO says no - must remember small business job [which undoubtedly seemed

Possible marginal effects from
MMDA-2

11/19/62

Dose - 10.4 mg orally \approx 115 μ g/Kg -

The bulk of indications show a good chance that this level is actual - if 50 - then 150 or 200 μ g/Kg may well be an effecting dose and will therefore be maybe 25 M.V. This would have wacky implications, strongly challenging the whole mechanism theory.

At 10:00 mentioned to AO possibility of effect - as if I had been drinking heavily the night before - a slight unreal feeling - 10:30 there was pupillary dilatation (\approx 30%) - right eye, as usual, more than left. 10:30 - unreal feeling completely believable - slight muscular twissings - warm feeling in genitalia - no nausea. Slight diarrhea. (12:00) eaten well but felt mouth didn't work right - this is very similar to DMDA see page 36 at 4:45. This should be verified at first opportunity.

2:00 PM - dilatation gone - muscles all OK again.

11/22/62

51

Date 11/21/62 - apts. 15.7 mg or 175 µg/kg calculated as free base and 5' body wt. at 170 lbs. Observers aware of experiment in progress AD, forwards and AP (below is transcript of my actual written comments during intoxication [comments in brackets added now]). All times corrected to 0 hrs

- 0 in. 15.7 mg.
- 0:50 initial dizzy.
- 1:10 I have intoxication slight - no pupil dilation.
- 1:20 tingle in legs - teeth rubbing - I have the "dizzy - hot - over - head - descending" feeling [see below].
- 1:30 going under - my mind won't concentrate on my chemistry [I enjoyed this part, see below].
- 2:00 very few toxic effects - mentally I am clear when I talk - what is the matter with me. It is as if I were dizzy, but I am not dizzy.
- 2:10 the mescaline hints are strong again (back of hand, color of sb. shirt [short]), - sufficiently little toxicity by body.
- 2:22 there are 2 scientists left work [see below] puke 80
now AP
- 2:30 scientists still at it - shame only I can be affected to. My thoughts are worth so little...
- 3:00 ended talk with PAUL
- 3:20 start out
- 3:40 eat OK
- 4:10 OUT OUT

[there were about three short relapses, for a minute or so, after this - one at 4:45 - one at perhaps 6:00 and one later - each brought the thought that I was going under again, but the thought was promptly forgotten. I sleep fine - next AM. no effects at all.]

I have read pages to in this notebook and understand their contents. There are no blank pages, except All entries are in the handwriting of

page 40 continued:

This drug showed several effects that are best explainable in terms of TMA and of mesocaling.

The 'overall effect', described on page 40 as "dizzy - hood - over - head - descending" is directly from TMA. In it one has good vision, good sense of hearing, and can think and talk satisfactorily. It is that something all around you, possibly over you as well, is restricting you from the world. An extremely loud noise, deafeningly loud, which you can't hear. One may ~~be~~ sit for a while, be aware of being able to think well, no problems, so stand up with the stated conviction that the whole thing is psychosomatic, an imaginary illusion, but there it is - the DHOHD all around you. True, you can't hear it, see it, feel it, but you know it is there - no one else around you is even aware of its existence. With MDMA-2 it was there for a couple of hours. With TMA it appeared and actually came in on me, eventually to the point of threatening to cut off my vision and my hearing. Perhaps \pm MDMA-2 at higher dosages it may close in too. If so, watch for TMA-like hostility.

One thing must be said for this "hood-effect". It in certain ways insulated you from extraneous distractions, if you want it to. Admittedly, sounds, sights come through, but you can ignore them - at higher levels, without doubt you will have internally generated sounds and sights to help distract. Perhaps this is a valid imitation of initial schizophrenia.

The philosophical flexibility and wit were very reminiscent of mesaline intoxication. As recorded in my notes "my mind won't concentrate on my chemistry". Actually this was said because I wouldn't trust myself to correctly weigh out several samples of a material in the lab, for aq. screening - I couldn't be sure of the right weight, right

gentle, etc. But the play of my own chemistry (biochemistry) - the drug, coupled with the lack of mental concentration, gave rise to a humorous train of thoughts. This *Macabre*-like philosophy was present again in sitting in my office, looking through the window into the lab, and seeing

XENON

YAGO

intently discussing a problem. I was aware, that they were preparing to set up the zone-refiner for the purification of Benzoin acid. I could watch the show, strip away the hypocrisy of it all, and recognize the force inherent under all their acts. Quite a moving and it went on and on. But I was the only one watching, and I knew it was worthless for them to try to impress me.

The absence of physical toxic manifestations was noted and appreciated. There were very little muscular effects, slight eye dilatation, no nausea; however, the thought that it might be difficult to urinate recurred (as with DOMDA). Slight difficulty during intoxication, none afterwards.

 2) Best results w. 40-60 mg
 3) Qualitatively different from TMA-1, but comparable to TMA-6. Also different from MDA & MDMA.

FOLDOUT BLANK

Chronology of Intoxication and Description of Effects*This from a Dow
report GP 1039*

All times in the following are stated as times from the first ingestion. Observers' notes have been interwoven when appropriate.

0:00

Ingestion of 12.5 mg (as hydrochloride) or 140 $\mu\text{g}/\text{Kg}$ as the free base. (There had been no food consumed during the previous 12 hours.)

1:00

Ingestion of a second 12.5 mg. (TMA-2 has a very slight alkaloid-like bitter taste - neither unpleasant nor lingering.)

1:20

Pupils show slight dilation, light muscular tremor, initial nausea, and an onset of diarrhea.

1:30

Cholinergic effects moderately severe. Teeth are chattering and vibrate when rubbed together. Pulse 80.

1:40

Only a moderately severe nausea is left. As has been observed with LSD-25 intoxication, the symptoms of nausea are complete,

except for the desire to vomit. This phase receded over the following 20 minutes. Pulse unchanged.

2:00 to 3:15

During this hour, the complete syndrome, except for intense color effects, of severe mescaline intoxication developed. There was essentially no nausea, and the world was filled with distorted, moving things, all quite humorous. Peoples' faces were grossly distorted, and there was very little thought or worry of personal safety. Muscular coordination quite good. Time passed slowly. Conversation both coherent and clear.

3:15 to 4:30

At about 3:15 the first indications of still further mental and physical capitulation to the drug became evident. A numbness of the fifth, and part of the fourth, finger of the left hand was frightening, and the recovery of this "asleepness" constituted a mechanism of preventing further inundation. Compulsive massage controlled this physical dissociation although asleepness of the

SUBJECT

DATE

knees, muscular and abdominal cramping also began to occur. In cycles there would be periods of relative simplicity followed by periods of nausea which could be relieved in part by attempted (but unsuccessful) vomiting.

Simultaneously with the physical cycling occurred a mental, intellectual occultation that, fortunately, possessed a different period. From the beginning of this hyper-mescaline stage (about 3:30), waves of near-unconsciousness occurred. The hallucinatory motion-of-real-objects became unavoidable and overpowering. Periodically, at the crests of cycles, an impression of fainting would occur, and it was felt certain that to lose the thread of return would mean never to recover mental integrity.

Fortunately times of mental and physical stresses did not correspond. Subjective time was badly distorted. A short visit to a dark room was unbearable due to the active and frightening hallucinations.

4:30 to 5:35

At about 4:30 a return to a recognizable "mescaline-intoxication" was the first believable indication that there would be an eventual recovery. A drive through the countryside proved to be extremely humorous and enjoyable, comparable to peak effect at about 500 mg mescaline.

5:50

Rapid recovery from the above effect. Increasing periods of lucidity. Completely unable to eat anything.

7:00

Able to drive a car without misadventure. A mild stomach ache was the only remaining physical symptom. Occasional touches of unreality did still occur but were completely controllable.

12:00

No remaining effects. Appetite good. Sleep normal.

Conclusions

This drug, TMA-2, has an apparent potency of 20 to 25 times that of mescaline, and of perhaps 10 times that of its structural isomer, 3,4,5-trimethoxyamphetamine. If more complete studies show no increased toxicity for TMA-2 (all amphetamines so far have been similar to one-another), the improved therapeutic index (x20) would warrant the consideration of this chemical as a substitute for mescaline in psychotherapy and in clinical uses.

of 11/26/62 - See page 54-55.

BOOK NO.

DATE

Sitting with AD - between tendencies to faint.

I am sitting rubbing the fourth and fifth fingers of my left hand. This one of the last contacts with reality. Somewhere I have read that ~~malig~~ malingerers (those who shun illness to avoid obligations, however you might spell them) during subscription to the services, generated partial paralysis of the hands, and described what was known as the glove effect. The initial paralysis should embrace the termini of the fingers, a more complete effect embracing the hand itself, a total effect inactivating the entire lower arm. In my elementary elementary course in psychology I have learned that the true physiological sequence of manual paralysis extended vertically through the fingers.

For possibly this reason of knowledge, for possibly the reason that it really occurred this way, the little and part of the ring finger frequently went to sleep and the recovery from this "dleepness" constituted one real mechanism of recovery of the "same" world.

I have always had a morbid fear of various parts of the body going to sleep, in that if the sleep portion should embrace more and more of the whole body, that the disconnection of the mind and soul should be permanent, if and when the head or heart should, in turn, fall asleep. This memory and compulsion were sufficiently acute that I would not and could not let the numbness of my left two fingers spread. I rubbed them incessantly.

The body was experiencing, simultaneously with these effects, muscular and abdominal cramping of sizable proportions. In cycles, there would be periods of relative simplicity, where massaging of the knees and thighs would seem to be a satisfactory placation to the immediate ataxia experienced. These would be followed by periods of nausea which could be

SUBJECT

BOOK NO.

DATE

released by attempted (but unsuccessful) vomiting. Still, during these latter periods the impression was held that to curl up in one's own world and not to have to face the proprieties of laboratory life, would be ideal.

Simultaneously with the physical cycling occurred a mental, intellectual oscillation that, fortunately, possessed a different period. Once the mescaline-like intoxication had been displaced (the beginning of this middle period), waves of near-unconsciousness would occur. The 'motion-of-real-objects' pleasure of mescaline became a thorn of existence in an unreal world. Periodically at the crests of cycles, an impression of fainting would occur, and to lose the thread of return, would preclude recovery of mental integrity. Fortunately times of mental and physical stresses, both individually almost uncontrollable, did not correspond.

The assurance was held that this mental 'fuzziness' was permanent. Requests to my observer, as to when the experiment would end, (his guess as to duration and as to when I would exhibit normal behavior, prompted me to try to achieve certain actions in a strained coherent manner, that would be acceptable as "normal". AO, of course, could give me no believable guess. In this light, I left him and went to the library unattended; also I proof-read and signed a letter to ZED. In near panic, I returned to the safety of my observer, convinced that my present state was irreversible and that I would have to adapt to life, henceforth, filled with learned actions (to appear sane) and frequent visits to the news room (to relieve nausea).

TUESDAY

The initial dose was taken at the lab, as noted, at 10:15 AM. Employing the analogy gained heretofore, there would be, comfortably, at least an hour before effects, if any, would become debilitating. During the 10:15 - 11:15 period of grace, I drove the incredible Studebaker truck to Lafayette to procure a 1/2 yard sand, and had a spirited contest with a highway patrol officer whom, I was certain, was more concerned with the 1/4 quart/10 mile oil-contribution to the ozone problem than to my abilities as driver. In any event, there was no incident.

Sometime after an hour, I became aware of some intoxicative effect, while I was talking to the man who did the discing around the farm. I had opened two tall beers, one for him and one for myself, and although the day was hot, I could not drink more than a sip of mine. I immediately thought of the experiment and deduced that beer, regardless of how deficient in ~~stuff~~, might have an adverse or confusing effect on the outcome. So, I listened to him talk for 1/2 hr, while I made what must have been inane and inconclusive conversational plays.

He left to make a phone call, and then returned to his tractor & discing equipment. I returned to my bricks and knew that it would be futile to mix mortar. I could indeed

6/18/63

SUBJECT

DATE

lay bricks if necessary, but I had no heart for it. The piles of bricks (some 20 bricks high, i.e., 2x10 or about 2 ft.) had that "continuous-in-motion" style of falling associated with mescaline. See page 2. It was extremely enjoyable to watch the bricks in continuous performance.

At this time I had my first serious thoughts about telling BK of the experiment, but decided not to. Some how, I knew that ~~if I could~~ I could probably fool her, and her not knowing would provide me with convincing evidence of the apparent normalcy of my actions. There was also an element of selfishness in it as well. Incidentally, there was quite extreme pupillary dilation at this point - there had been absolutely no indications of nausea or physical malaise with this material.

[I have just read (6/18/63) that, although the route I had used in the synthesis of this material

has been reported (JACS) and confirmed (Ber.) as yielding the isomer shown, a report in JACS recently claimed the generation of the lower melting isomer $\begin{array}{c} \text{O} \\ \parallel \\ \text{C} \\ \diagup \quad \diagdown \\ \text{C} \quad \text{C} \\ \diagdown \quad \diagup \\ \text{O} \end{array} \text{OCH}_3$ in equal amounts, which would have led to MMA 3b.

In my notes, I observe that I did not characterize the aldehyde from this formulation, but converted it directly to the nitro-styrene $\text{C}_8\text{H}_7\text{NO}_2$. This olefin was nicely obtained only after recrystallization. Although it is a 100% shot, it is conceivable that this response was due to MMA 3b. The compound is certainly unique (sharp melting nitro-styrene) but its structure permits argument. The unambiguous

synthesis, through the feasible nitro styrene of MMDA-3b, is being pursued forthwith.] [ATS 8/29/63 - It was indeed MMDA-3a]

At about this time I became involved (as I had with mescaline) with the captivating world of insects. I found a measuring worm, and with great tenderness and patience ~~to~~ picked him up, observed his fore- and aft "feet" and finally placed him down on a leaf and watch him acclimate himself. There was also a spider on the bricks, and I was compelled to watch him in action. I was grateful that I was not being observed, so that I should not have to appear dutifully employed. Time was ~~no~~ quite slowed. I checked periodically with the kitchen clock - it moved quite slowly. It was necessary to move, intentionally, slowly, so as not to exhaust myself.

As mentioned in the chronological display (page 66) it became apparent to me the extent of the pleasure-giving (and possibly activity-enhancing) properties of the methylene dioxy ~~to~~ group as contrasted to the analogic dimethoxy pattern. Compare: Amos reported grey doughnuts and more on v 126 mg 3,4-methylene dioxy amphetamine, whereas there was nothing on the dimethoxy analog (same amount). This, at least supports the ~~former~~ potency argument. There rests the enigmatic report of "no improvement over mescaline" description of 3-methoxy-4,5-methylene dioxy phenylethylamine. MMDA appears possibly more active than TMA, and distinctly of more gentle effects. ~~It is~~ Also - MMDA-2 looks to be comparable to TMA-2 - but certainly none of the individual panic that accompanied TMA-2. Here, it is true that TMA-3 is untested (in truth as of the moment still in the nitro-styrene stage, so still not even synthesized), but ~~it~~ already, I am quite willing to test MMDA-3a, as it allowed a friendly experience.

At 12:46 PM. BK made some sandwiches as lunch, and I volunteered to share them. My customary habit of a bit of Pinot C. + tuna sandwiches was converted to 7-up and ice. The sandwiches were uncatchable. BK comment mid-way that the pickles were bad, and I was overwhelmed with the recognition that I was unable to distinguish bad from not-bad. Intellektually I knew that the sandwiches were OK, but they ~~felt~~ filled my mouth unceasingly, and I gave up. Instead, I watched birds ~~was~~ circling above the newly plowed field (we are on the new patio) and sipped (and enjoyed) 7-up and ice.

The concept soon arose (in ~~the~~ the notes, about at) 3 hrs.) that this condition might be permanent. True, this consideration has often arisen before, with LSD, as well as with TMA-2 and mescaline. However, with all these other materials, on all previous occasions, the rational ~~goal~~ had been set forth that it would be possible ^{even} necessary, to learn and imitate the behavior of normal individuals so as to ~~to~~ perpetuate the sham of normalcy. In other words, one could and must set about learning to act in an acceptable normal manner, so as to conceal the true state of affairs.

With MMA-3a, the concept that flashed past the ~~mind~~ mind was totally opposite and is recalled here as well as possible. Here, it was, as mentioned above, considered a real possibility that the changes observed might be irreversible. The challenge appreciated, was ~~to~~ not only to imitate "normal" behavior as would be necessary to fool one's associates, but to plot an ~~an~~ extensive campaign of gradual change of personality so that, after a period of weeks or months, one could relax back into

SUBJECT

BOOK NO.

DATE

~~As~~ this pleasurable escape and have it accepted ~~is~~ go usual behavior. In other words, the capacity for intellectual plotting was, far from being lost, quite available.

It must be held noteworthy that both; 1).

this quite recherché concept was totally recallable, and; 2) his attitude may well represent the approach employed by endogenous schizophrenics, in the concealment of their problems. It further is undoubtedly coincidence that this concept first appeared with this specific drug. It might be me.

Between 3 $\frac{1}{4}$ and 3 $\frac{3}{4}$ hrs (\approx 3 hrs was max. effect) I rested, in the presence of sleepiness, actually to avoid brick-laying and close to fry closed-eye effects. The results were questionable. I couldn't lie still. In pseudo-darkness, there would be some structured illusions or ~~as~~ as with LSD (commonly called eyes-closed hallucinations, but actually ~~closer~~ closer to the so-called brain-movies of MMDA. These were interpreted in an erotic framework, not unpleasantly extended by the awakening experienced by BK at 1:45 P.M. If left alone, I could have enjoyed my own company. The effects were pleasant.

There was a precipitous decline of intoxication from here on out. Soon, there were ~~no~~ no mental retreats, and thus 'laid bricks' all afternoon, and had martinis before dinner.

Afterthought - lost of car-drivability during intoxication. Probably impossible.

Overall conclusion. a) will explore upon BK or soon; also, will repeat - pleasurable and perhaps rewarding.

XV-136.

MEM

Claudio's notes.

1. - 5 mg (IRVING) no effect
2. - 10 mg (BE) " "
3. - 15 mg (BL) threshold. Duration approx 60'. Reminiscence, anger
4. - 20 mg + 30 mg (after one and a half hours w. no effect). Onset of effects at
 ↳ (BM) so: comparable to 75-100 μ LSD).
5. - 40 mg (BE). Comparable to 75-100 μ LSD, or 60 mg TMA-2
6. - { 20 mg (BN) threshold. after 2 hrs:
 { 12 mg (adding to 32 mg): compared to 100 μ LSD
7. - 30 mg (AR) " " " or 60 mg TMA-2
8. - 30 mg (CLADY) " " "greater than 20 mg TMA-2

Conclusions: Threshold at 15-25 mg (20 mg except for 5 & 6 but not 4)

{ For 3 Ss, 30 mg compared to 100 μ
 { For 2 Ss 40 and 50 " " 75-100 μ

The latter seem ~~therefore 40 mg seem to be~~

psychologically more rigid and defensive. I would estimate in
 30-40 mg the average effective dosage in psych-te.

Dose
 equiv to 75 μ : Comparison to TMA-2: Apparently more active.

FOLDOUT BLANK

SUBJECT

Marginal effects MEM.

DATE 10/4/63.

Subjective evaluation

Time 6:35 AM (O time for chronology.) dose
 10.5 mg^(10cc) orally in ~ 15 cc water - at this
 dilution, no taste. M.W. 275.5 → 239 or 9.1 mg base
 at 184 lbs' currently → 83.5 Kg ∴ ~~mg/Kg~~. $\frac{100 \mu\text{g}}{\text{Kg}}$
 105.

- 0:45 slight pain, base of skull - probably not related.
 0:55 first intoxication - no sign of nausea at all
 was talking with IRVING and felt initial
 dizziness - ~~that~~ had to get up & move. Some
 physical poisoning in legs.
 1:15 tell AO - I knew I was intoxicated (in EtOH
 sense) but was not apprehensive. At that time
 I knew 50% increase in dosage would have been
 too much. Slight dilation if any.
 1:55. Mentally I seem to be OK. or at least
 rapidly mending - physical toxic signs
 persist. A bit disappointed that if I need to
 be physically poisoned, that I shouldn't be
 mentally entertained in compensation.
 3:35 Consume cookie from AO. clear as a bell but
 wish I could get out of noticeable but mild
 physical distress.
 5:20 consume two hot sandwiches & beer. ~~all~~ all
 over.

This is marginal but unquestionable real
 effect. - assume effective dose ~ 4 mg as above
 ∴ 145 $\mu\text{g}/\text{Kg}$. ∴ at mesolium MU=1 3.76 mg/Kg
 this has 26 MU activity

MMDA Experience

One half hour after taking a dose of MMDA, I felt some nausea. This lasted for a short period (15-20 minutes) and seemed to be connected with cigarette smoking, which was discontinued for the rest of the day.

Then there came a temperature change. I had some chills and felt somewhat dizzy.

Finally my whole body became relaxed, languid. A wonderful feeling of peace and well being came about. It was just a joyous feeling.

Every one and every thing around was harmonious.

The colors were ones, believing I'd never seen them so vividly.

SUBJECT

before. They seemed to take 1st on another dimension.

Time lost its meaning.

Reflexes, senses, body movements all seemed normal.

The only difficulty I experienced was at the beginning of the day, trying to light a cigarette.

It took time as long, it couldn't seem to judge the distance correctly, between the match and cigarette.

It was a most beautiful experience.

COWBOY

RECEIVED GOOD FEELINGS FROM DOSE, WHICH LASTED FOUR TO SIX HOURS. SEEMINGLY ABLE TO CONCENTRATE ON THINGS MORE SO THAN USUAL. FEELINGS OF PEACE, QUIET, and CONTENTMENT. LOVINGLY FEELINGS FOR EVERYTHING.

4 Feb 64

Dear Sasha -

A quick report on Dom, since even if I called you would want something written.

1.0 mg, no effect, perhaps slight mood elevation.

1.5 mg slight mood elevation, a little greater than before.

3 Feb 2.3 mg. Mood elevation at 2-3 hours, after 3 hrs emotional effects became more pronounced, enhancement of color also.

Very little distortion of perspective, no disorientation, no creeping or floating, but color enhancement considerable. The emotional content and empathy for others was closer to ~~amph~~ mescaline than to amphetamine, a welcome change.

I would judge that this dose was comparable to 100-120 mg of TMA, (i.e. ~50X) but qualitatively different, in the direction of psilocybin or mescaline. No

suggestion of nausea at any time; toward the end, 4-7 hours, some intestinal gas and flatulence, perhaps not directly attributable to the drug. Major effects declining at 8 hrs. Unable to sleep at 9-10 hrs, took $\frac{3}{4}$ grains Secnal.

Headache next morning, and listless, more probably attributable to Secnal.

I would put mean effective dose = 3.0 mg, (mescaline \approx 330), or \approx 100X mescaline. This is a good one!

← ERROR - HE HAS NEVER RECEIVED THIS FROM ME. HE MEANS 2,4,5 or 2,3,4. By phone, he meant 2,3,4. 1/5/64

As for 3-methoxy, 4,5-methylene dioxy β -phenethylamine, I am up to 65 mg with nothing more than a very pleasant mood elevation.

I'm not sure I have enough material to go higher than this, or, for that matter whether it is worth it with Dom here. Worth it for the record.

I trust you will have gone another factor of 10 by the time you get this.

When will you have the afternoon for Ann? Regards,

GLADYS

July 7, 1964

see page 92

Chronology. - corrected back to 7:10 AM = 0 hr.

0 hr. 7.8 mg. in H₂O orally - virtually no taste. no eye dilation & no indication of any effects

1.5 hr. eat doughnut - 1st food 12 hrs..

2.0 hr. 3.6 mg. no further effect.

4.0 hrs. had concluded that there was to be no effect - decided not to supplement dose however, as there was the slightest indication of pupillary dilation. I tell AO of failure.

4.3 hrs. 1st distinct awareness of physical and mental effects. Very disturbed as this ~~is~~ indeed may be the crest of activity showing up and will subside - ~~or~~ or this may be start of a much slower onset of actions. warmth in base of belly

4.8 hrs. Eat lunch - no difficulty, unlike low levels of mescaline. when eating (mouthing) of food is virtually impossible. I was loquacious in my discussions during lunch - seemed to be able to think clearly but still held to much anxiety. I remember the interesting urge to be ill, but not from the top of my stomach but from the bottom. Consequently vomiting would be

SUBJECT

DATE

unless in relief, and had to urinate to release. There was no movement of things, no color effects, no paraesthesias.

6 hrs. Accepted opportunity to go to Western Regional Lab \bar{c} AQ - However the question of crest vs. onset of long action (DE) was not resolved so withdrew and stayed \bar{c} AO. Since his LSD he is an excellent understanding observer. I don't know if I could count on AQ - At least at this moment I didn't want to.

6.3 hrs. First completely clear moment - 10 minutes or so. It was comforting to know it would clear.

~ 8 hrs. all O.K. - felt quite tired - home - 2 drinks - good dinner - hot shower and slept excellently.

48 hrs. just work - absolutely nothing.

This material appears to be of about the same potency, although considerably slower acting, as (than) TMA-2, of which I was occasionally reminded. Activity thus in the 15-20 M.U. level.

## T.S. 2 TMA-2

2, 4, 5 trimethoxyamphetamine

Sat melt  
at 66.1 kg

(60 mg/kg)

24 July 65

10.0 mg oral 6<sup>45</sup> pm (15 min before dinner)

0.5

7<sup>15</sup> pm - (15 min after dinner started) aware of beginning of effect

1:15

8<sup>00</sup> pm - (At poetry reading) Effects clearly beginning now

3:15

10<sup>00</sup> pm - Peak of effects. Approx equivalent to 250mg mescaline or 50% LSD. Peacefulness of mescaline not present but ~~rather~~ <sup>not</sup> agitated lack of empathy of TMA either. Perhaps <sup>most</sup> like ~~psilocybin~~ psilocyn. Strong emotional effects as with LSD, empathy. Strong color effects, little if any perceptual distortion; ~~although~~ peripheral vision was odd, areas tending to black out slightly, as if a black cloud of steam had momentarily appeared in the peripheral vision. No anxiety, but I could see how a dose 2 1/2 times as large (as Sasha took) would ~~produce~~ <sup>produce</sup> anxiety, as I could project the effects of TMA to the "hostile" reactions that others get at large doses.

at least as much as mes. ←

12<sup>30</sup> PM, bed - took

1:00 AM sexual

no stomach problem - next day maybe dizzy - maybe not.

11 Sept 63

Sasha -

GLADYS - MMDA-2

Two enclosures - 1) the reprint you wanted  
 2) my naive (chemically) mind relates usnic acid in some vague way to Gini's compounds; possible chemical precursor?

(First 7.5 mg, no effect)  
 Cmpd #2 test; 25 mg. approx equivalent to 250 mg TMA, little opportunity to examine eyes-closed visual effects. Had the same jangly not-too-pleasant TMA effect; I had no rage reaction to this or to TMA. Definitely not like mescaline. Duration; onset ~ 1 1/2 hrs (dose after lunch), acute 3 to 4 hours, ceased at 9 1/2 hours to stop residual effects so I could sleep. Occasionally from 5 to 10 hrs acute abdominal distress, resembling gas pains but unable to defecate. Abdominal muscles tight and hard. This occurred for about 15 minutes every hour or so. Rather unpleasant. If 3a does not have this effect, I would much prefer it without that methyl group, i.e., the mescaline analog instead.

We should get together again soon; HOWIE will be in a swivet for a while until her teaching gets settled into some kind of groove.

Tried HUGH'S Stropharia; 50 fruit produced effect approximately like 300-400 mg mescaline. I thought not as pleasant.

See you

SUBJECT

→ Details on DOE  
continued:

The effect of DOE on the mood is certainly the most startling. Although I was aware of almost hyperthyroidism in the period 4-10 hrs., the effects were clearly visible by Nina on into the evening (to 16 hrs.). She described my behavior as a wound up record that went on and on, and at the end someone picked up the arm, and placed it at the start again.

There was a drunk-like loss of inhibition to all behavior and speech. At bridge (5 hrs) I bid 3H over an opening 1H (from my right) to see AO's resources. He alone was aware of the experiment. (I held the inadequate 7 heart suit to the AQ109, an outside singleton, an Ax of ♠ and 3 losing diamonds). There was the joy of experimenting with others.

— Not too much sensory change, except for the apparent sparkle on everything. It was like looking across the ripply lake towards the sun. Every bit of light reflex in hand some degree of enhancement. Color changes were not noted, although the texture of the face (AO) was distorted.

— Pretty clear most of the time - this was the date of XENON's leaving for New Jersey, and it was during the day, that word got around the lab. As I had been told in confidence, and I was not sure who officially knew or not, and I was somewhat unwell  $\pm$  DOE, I felt quite confused. However, this day also I had the academic problems of denterating bariumline, making Dce etc, and these were kept clear.

At perhaps 3 PM there was muscular problems in the legs at 4pm my familiar kidney pains. After dinner (6 PM) all was fine and no more problems.

GLADYS ~ 9/28/65 1.7mg. Hcl - intense lethargy - got absolutely nothing done all day - next day suffered the most profound depression he has ever suffered. Possibly DOE at fault.

KOZ Subject  
200 mg.  
~ July 1965

Anxiety; insight (upon which he elaborated to great detail; could turn on and off at will -

Had tea w his mother, and she had no indication of intoxication.

Generally unpleasant - found himself concerned more with personal life, less with mythology which (the latter) is what he prefers and experiences under other drugs.

a delirious  
Scientific Med student  
background; yajé  
also yajé (harmaline)  
→ mescaline

250 mg MMDA. ~ July 1965

called in panic - by time  
KOZ arrived, was happy - was doing  
pseudocalothecia. very pleased  
with himself

→ rebelled against suggestion  
of closing eyes - stated "was a  
very bad question". when eyes  
were closed, unpleasant feeling  
- 2<sup>nd</sup> hour. rebellion only when  
attempt made to delve into the  
person.

4<sup>th</sup> hour - KOZ returns again - subject  
was pleased with some of his visual illusions. Specks on wall became  
insects.

→ 500 mg Harmaline → unpleasant  
→ (E dramatic) bad  
vibrating; cats → leopards - anxiety -  
open door to interest in taoism - has  
become humble-like studying.

→ 300 harmaline + 200 mescaline  
less visual, less feeling - but has  
concepts without images. Colors OK

was pleased with some of his visual illusions. Specks on wall became  
insects.

♀ subject visually oriented -  
Extremely unpleasant history  
w harmaline - led to  
amnesia, convulsions. w mescaline  
KOZ is monster, also chair is a  
monster.

Originally frigid hostile, but a  
poet. w harm & m's work → gentle-  
~~but~~ but no poetry.

300 mg MMDA ~ July 1965

enjoy music - immense self-visit -  
recognizes love for KOZ. - rights poetry  
again. Here KOZ feels high therapeutic  
value - eyes closed imagery OK. but  
is mainly intensification of feeling.  
here is felt to be > mescaline or  
LSD.

again - auto controllable.

Details onto page 118

general comment - gentle - like pot  
not hard like  $CO_2$ , LSD  
at work (15 min)

8000 nausea - methadone effects

(30 min) LSD effects in the camp fire.

felt withdrawn - had cramps in stomach (as with LSD) - the  
visual field was lightened with eyes closed.

(1-1.5 hrs) - time slows. - geometric patterns. excess light  
kills the eyes-closed patterns

- there is chest numbness, warmth - some vertigo  
with eyes open.

- No taste in mouth (LSD yes, mescaline no)

- passive introversion

- people appear on beach - no paranoia (LSD yes)

- after images bright - long lined - 3D corridors, faces  
upside down - dry mouth only slight (LSD dry dry)

- some color effects, telepathic maybe - feels could  
be useful as an introductory drug.

- Benign - can turn on and off.

2 types of hallucinations:

↳ retinal (looking as into a basket)

↳ occipital (whole field)

♀ same  
time

150 mg easy in, easy out; (gargulous, withdrawn)

♂ JAY

150 mg Time disorientation (6 hours duration)  
unable to drive car. this report in  
original words

MMDA - 5/30/65

BOOK NO.

DATE

MMDA

may 31 eclipse day-1965

drugs were taken at 11:30 for KOZ 100 mg BISA 15 LSD and later 40 ritalin

may 30 BISA took MMDA 100 mg while I had harmaline this report concerns BISA's  
mmda ~~mmda~~

It seemed to take 45 minutes to work and then came on very suddenly and 'hit' me almost like a blow on the head; as if my eyeballs were being pulled out and my whole head expanding; Soon a COLD feeling set in and shivering; this was not unpleasant but was in marked contrast to the Ritalin which gave a warm feeling of activity and verbalization entirely different than this

The cold was as if I was in carbonated water (this occurred as I was having the vision of a carbonated pool of water or nearly at the same time in retrospect) there was no anxiety; then the light seemed to dim in the room - this a retinal phenomenon or having to do with the eclipse? in the Pacific at about 3 pm;

My state in about 2 hrs seemed to be one of empathy and passivity, compassion of an impersonal sort; the music sounded artificial and canned and tinny in contrast to the voices which sounded rich full and finely precisely articulated and melodious

Also I had the impression there was a lot of stuff in my head I was not talking about;

Later when left alone the hallucinations occurred; as clear as any I have had on other hallucinogens; (c)

these were not kaleidoscopic or assembly line or oriental patterns, but life like with vast open spaces (typical of her paintings and essence person patterns) with people moving slowly and realistically much realism; I could conjure up monsters when asked but these had an artificial quality - they were eating something;

other visions of much food preparation and skinning and preparing of animal kind, drying scraping etc; many wild flowers and WIND-streams which were already part of the ocean; I regretted its wearing off; it did so very slowly; I was in a paradise concerned with externals and conforming to the structure we had set up and perfectly satisfied to be all available and all out there with you; the internal things and hallucinations later were interesting but the realism and nearness? not nearness I think -- of reality was very gratifying; a similar outerness with ritalin but it was more warm and dramatic not so ethereal;

no profound philosophical thoughts but direct sensations which started with physical then emotional; no thoughts or judgements of people or things; no facial distortions (she gets visual and auditory hallucinations - sounds of water running, creating 'music' of squeaks etc)

POSSIBLE USES  
good for one with a lot of anxiety which shuts him off from experience; those who are full of "I like, or "I don't like" they are so preoccupied that they don't see the things out there that are really going on, but project and shut off etc. I had a detached feeling while the ritalin seemed more personal and closely empathetic; sort of chummy and talky and pink tissue, mmda was more like clear mountain air

with LSD my thoughts go circularly, I get caught up in flippant philosophical ideation brain storms almost a mental masturbation

I was so preoccupied by KOZ's answers to my questions that (with ritalin) the images they caused in my mind caused me to be almost physically removed; feel this way KOZ seemed to 'work' to overcome the passivity this mmda induced

6/2/65

MMDA - 6/2/65

about 1/2 dosage

I found this drug not at all like any other ;in the first place there were no appreciable distortions hallucinations or eyes closed imagery;second the mind was quiet;no words explanations comments theories and rational thought subsided; third I was fully aware in present time especially during the first few hours fourth;despite the seeming short action of the substance there is a time disorientation which lasts over six hours which undermines ones judgement in driving a car;so at least 12 hours should elapse before driving is undertaken;

in use of O2-CO2 to potentiate the action of the drug there was a most remarkable effect As though a floor of some sort was dropped from beneath me and yet I was still supported and with this floor dropped a general feeling of anxiety of a free floating type which has been plaguing me for several months;later on a half hour or so later;when I was exploring the area newly empty of anxiety I felt it again for a few moments and then it dropped away for good;I was completely without tension or pressure of any sort;I expect that the effects are similar to that of a tranquilizer or an opiate(although I have experienced neither) except that there has been a long term change as a result;

MMDA JAY co2 and o2 used to set it off

I felt as if a floor of some sort dropped from beneath me and yet I was still supported ;with this floor dropped a sense of free floating anxiety which had been plaguing me for several months

30 min later

when I was exploring the area newly empty of anxiety I felt it again for a few minutes and then it dropped away for good and I was completely without tension or pressure of any sort; like being tranquilized or morphine

but ive never taken either ;there has been a long term change as a result

6/2/65

this drug was like none I have ever taken; no hallucin noted and no distortions of what I looked at (I agree with the lack of distortion of outer objects or faces) second;the mind was quiet no words explanations comments theories or rational thoughts fully aware in the present time especially in the first 3 hours there is a time distortion ;6 hours later WHICH UNDERMINES ONES JUDGEMENT IN DRIVING

i misjudged the traffic lites duration etc

MMDA reports

#1 49 yr old male; set relaxed to very slight anxiety over personal emotional matters. SETTING: De Martin beach off Falce-klamath rock 8/29/65 11:45 AM  
11:45 150 mg

12:00 slight nausea and methedrine/ritalin like effects

The 3 of us are at the falce river mouth drying seaweed on split redwood  
The fire burning preparatory to cooking the rock crab just caught takes on a fantastic appearance

12:10 I withdraw, the talk of the others is too much; she puts on sunburn oil  
WOW

12:15 the tiny fairy feet of the flies slight cramp like slight nausea and my visual field starts lighting up

12:20 some vertigo and heaviness and time stretches out; numbness in the chest as when an opiate is taken;

Still study geometric patterns; excess lite on closed lids interferes with (retinal) visualization, vertigo only with eyes open

dance of the glittering diamond studded sea waves; increasing motion and beauty  
No taste, just passive introversion with large time lag

12:30 people appear on the beach and talk to my companions; I have no paranoia this surprises me;

12:35 trembling after images are very brite and last long; I see a long corridor and faces upside down 3D corridors that bend and recieve me  
basket likew with visions at the bottom;

the man will drive and the woman provide; two beauties and crab  
thirsty and mouth slightly dry; much less than with ritalin or LSD etc  
green to rose after image

NEED A SEMI SLEEP STATE FOR NEUROTICS /PLUS THIS DRUG /so they can let go to its effects better

Increasing landscapes appear inside; inwardly I told her of her beauty and the outward she also responded by looking up at me.

(this is a good introductory drug to the drugs of this class)

to become familiar with the drug state in as gentle as possible a fashion

Later; i see my mother in animated conversation with another woman  
this was at 1:30

12:50 to give self robes and to cut off the trash and 'worry' so as to enter the semi dream state where you are protected; not as noisy (many) dreams  
?as in live? or more?

music or sea

as a structured backdrop against which to go in

bold kneeded wrestler geni probably on waves Like LSD neck barred woman  
sits up man upside down face; fabuluous kiss bitter crab and people  
million fingered dance of the sea; green apple crunch

I hallucnate lists hungarian rapsody

and then waltzes

then see at 1:30 my mother as above.

Remarks: this substance seems to have a much genteler action than others of this class; perhaps more like Cannabis or psylocybine; there is little paranoia reported by anyone

I noted the hallucinations of two types: one, those which were strictly retia retinal and more minute and small and influenced by lite and evoked by 'foca using' on the 'lite' ahead on the retina or lids, and the other those deeper in the visual tract and occiput which are larger and more global dream like and when solid are quite dramatic and unforgettable as in meditation. There is less adrenergic or alerting effect per hallucinatory unit of this drug as well;

REPORT ON MMDA TAKEN September 5, 1965

OCEANA

Since in my walrus type floundering about since then, I've managed to lose all notes made at the time, I'll try to do it by recall and then will undoubtedly find them.

Drug produced light nausea and slight dizziness within about 45 minutes and shortly after began to feel "psychedelic" effect. For awhile felt like mild dose LSD with slight disorientation and visual imagery at closing eyes. Imagry wasn't the vivid, shapp-colors type however, but like a kalaidoscope filled with pastel colored smoke. Reminded me of a gadget seen in New York museum of modern art in which constantly changing swirling colors were projected on a screen. Every now and then across this field floated an unidentifiable black shape/blob. Overall general effect sort of like Rorschach ink blots.

Within an hour I felt my mind snap into advanced gear and attention focus like a laser beam. Felt I KNEW what I was about and was thinking with unusual confidence and clarity. Total focus on NEIL altho my response to him was less involved emotionally than it usually is in sessions. Was unable to cry for him or for self yet felt no hostility towards him or fear--just intellectual sort of endeavor and desire to do something effectual and positive. Was unable to account for some of his behavior and was very curious as to what diagnostic labels it would earn. Had an excess of energy and large overestimation of own strength--felt fully confident that I could hold down my half of NEIL with no trouble until I recalled that this wouldn't be my normal realistic appraisal and then began to force a bit more caution. Could feel my own emotional state being blocked as almost with a physical barrier - knew there was great upset underneath and that it would leak out as drug wore off but was unable to feel it totally.

Time sense was slowed--kept looking at my watch and thinking more time must have passed than actually had, but wasn't disturbed by this. When NEIL began walking around expounding his revelations I became restless - began wondering, wanting information and activity. I realized that as long as there was active action I could focus entirely on outside and was fine, but when things slowed down feelings of self coming back were distressing and I was stuck back with me and pain over JAY. Tried to turn it to interest in and learning about NEIL and about the total situation but kept wavering in attention between him and myself. By about 2 pm was ready to start on NEIL again, trying to get him to come down and sort of cut off. He was unable and I took it as sort of a challenge. QUE seemed unwilling to direct him strongly and I finally played on his need to "help" me by giving me an hour with QUE. It worked. Put on the saddest music I could in order to dredge up hurt over JAY and whatever it represents but altho tears were there, it was all dampened and toned down. Knew I was very upset but that knowledge was more upsetting than the upset I knew was there.

Went out to the pool when SURFER and PEGGY came. NEIL was all shaken, pains in chest, unable to breath, felt nausea and choking sensations. Was marching up and down, back and forth like ward patient in a yard. Was disturbed by this and went to tune the guitar on the piano with GLADYS. Felt BZ being annoyed by me in house and by my playing with GLADYS and knew I'd have felt hurt if it weren't for dampener of drug. GLADYS tuned the guitar and I went out to see what I could do with NEIL. We talked awhile and I found myself able to play that guitar like never before - was elated and entranced with my own music and new ability...especially since I found I could work with NEIL and play along at the same time, using it for sort of background and emphasis and attention changer. Talked to NEIL about pains in chest - had him try Gestalt exercises but he was too far out. I felt him as a little boy asking mama to fix it and I felt like I'd like to be able to fix it, but not indequate because I couldn't do so.

OVER

GLADYS came down, wanting attention and to sing and play the guitar. I was happy to see him and we began to sing a song but BZ tore out and jerked him away like a shot/ I understood how she felt and her worry about his contamination, but I felt resentful at being considered a contaminating agent so decided it must be PAUL she was worried about and rationalized it that way.

Spent time talking to PEGGY about her feelings since separation from SURFER and watching her way with her child. All along was playing one song after another and my attention was sort of split. PEGGY came on strong about dislike for SURFER but didn't realize she was saying it and by way of attonment ~~an~~ immediately began telling me a' ut how neurotically she operates - but in SURFER's terms and sounding like a parrot. I tried to be subtle and gently get her to see what she'd done, but it somehow didn't seem imprtant compared to PAUL wandering around painfully and looking at me like a sick puppy. So PAUL and I talked about the things that made him nauseous and he went and leaned over the fence a few things but explained that while these things would have upset him six months ago, they don't any more. Things such as "penis" and "breast" and "hand" and "hang". (I wonder if his mother hanged herself) I began trying to play Tom Dooley and noticed PAUL swallowing hard when I got to "this time tomorrow weckon where I'll be. Down in a lonesome canyon, hanging from a white oak tree" Also on "Poor boy you're bound to die" Began to worry that there was more going on than I was hep to and quit immediately.

SURFER came and PEGGY left. Felt warm even toward SURFER - allowed him to play big brother thing with me which is his wewest button to push. He showed me things on the guitar and I gave it to him and began playing with JAY. Noticed PAUL watching me play with JAY with tears in his eyes - he kept looking away. Felt some sort of vibrations emanating from PAUL - like he was silently begging, pleading, entreating me for something. Didn't know exactly what I could produce that would provide it. He was hungry and wanted a pear - I told him to pick a peach instead. He did, showed it to me like a little kid and ate it like one, leaving most of it all over his face. So I put JAY on SURFER's lap and began singing nursury rhymes. PAUL came and fanally sat down but with that damn shit eating grin on his face. I didn't know what to make of it so didn't.

Physical effect of drug most outstanding. Full of energy and coordination. Lost fumbling, clumsey feeling altho I did manage to whack my shin on the water pipe and trip in a hole twice. But that's par for any course. Knew this was the same stuff JAY had and kept wondering why I wasn't getting the same euphoric, limp happy eaction. It was a physical and psychic energizer for me but without the emotion emphasizing effects of dexadrine. Went home and to sleep with 3 pills finally at 2 am. Kept self curling in sleeping bag womb all next day and night and didn't want to come <sup>out</sup> to face the world on Tuesday. It isn't a nice world these ~~ada~~ days and it deteriorates steadily.

MMDA

In this experience each time he closed his eyes he observed internal visions all involving his present situation in school.

Vivid dreams & marked time lag

Feeling of Being Asleep

Nystagmus present (ocular) in all positions of gaze.

No trouble sleeping after this drug

Cross toleration  $\bar{c}$  Cannabis?

Dreams more vivid.

Feeling of weakness shoulders to chest

24 hrs after proven MD same effect. 6 days later effective again.

DATE

/MMDA

the patient is a 33 yr old male 225 mgs taken

I had a strange awareness of my hands in about 20 minutes; not a feeling in them so much as just that I was attracted to them somehow;

in a few minutes I began to get fearful-of ? loneliness of the acute experience of aloneness, I did not want to go back there again.

I laid face down (often a depressed position for me) Next I remember 'talking to the kids at school (an image) or to other teachers; this was very vivid; the scenes at school were more vivid than those in the office where I actually was. and the people more real than YOU. I tried to 'come back' by getting physically close to YOU. but still drifted off to school

I was very sleepy throughout (not the alerting effect of LSD) and four hours later went immediately to sleep (I never did with LSD)

I was bothered by the quality of reproduction of the music from 20 to 30 minutes after drug was taken - the crowded small office bothered me at first

of any experience I have had this was most like a series of dreams easily remembered (this drug is most sought after by our helpers in drug work - they function best on it as helping others) I felt after it was over as I had after a long period of sleeplessness - I had gone to bed and had a series of dream like states very vivid and colorful and real

this from BV ~ 11/10/65.

Dear Sasha and Gwys ;

here are two more reports very brief because there is little to say - The copies you have you may keep as I have another

please see that KOZ gets one of these copies and I guess Sasha is collecting so he should have the other one;

MMA 150 ~~20000~~ mg

an experienced person in the use of drugs; complete neurological done 1 hr prior to testing was completely neg-care fully looked for was nystagmus - he showed a slight physiol nys in extremes of lateral gaze - 1 1/2 hrs after the drug he showed about the same amount and the balance of the neurol testing showed no difference from that of 2 1/2 hrs earlier

his bp which was 145/90 to start was unchanged he only experienced a bit of tingling in his arms and legs and a slight sense that his hands were trembling, this was not objectively confirmed during the neurol testing he had no hallucin etc

MMA

the subject who is sensitive to as much as 8 mcgm of LSD noted the following within 30 minutes of injection of 20 mg of the drug a sense of tension in the chest not unpleasant, increased accessibility to affect with some crying appropriate to the occasion. The enlarged third dimensionality of music and slight unsteadiness in locomotion - also the usual tendency to introvert and withdraw. these effects seemed to be the equivalent of about 10 to 15 mcgm of LSD and lasted 7 or 8 hours with the peak at 1 1/2 to 2 hours.

I will be publishing a paper with TRACEY on vitalin and LSD and CO2 gas soon as I can get my part of it written

Comment was made ~ April 1966 by KELLY and friend ROBBIE of knowledge of MMA experiments, one ♀ and either 1 or 3 ♂. 220 mg each. ♀ & early onset - ♂ on later - lasting much of the night.

DATE

(See p 115)

The 1.05 mg was taken at about 10:00 AM. Awareness of an effect was noted at about noon. There was the same sort of abatement, quick thinking, humorous talks as there was with DOE, in fact this whole time structure and behavior structure was much the same (not, I believe quite as intense at 1.05 DOP vs. 1.5 DOE). The argument of sparkle is still true.

→ visual There is a little sparkle - went into total darkness for a little while - found that allowing image from door to fall on just one eye was unpleasant. With both eyes devoid of

This was stopped - this writing ↑ was at 3:20 PM and still quite under its influence - couldn't be bothered summarizing something up that still was going on. This ↓ written 4/10/66.

SUBJECT GLADYS on DOP.

DATE 7/31/66

GLADYS on 0.8 mg DOP (see page <sup>115</sup> 114)time rel. t.  
0930 0.6 PM. 8.5 hrs.  
Mid. 14.5 hrs  
AM.energizer - probably no sparks.  
peak? - medicine cabinet shimmers.  
3/4 gm seconal.  
hangover or seconal.  
maybe into)

23 hrs.? today?

Continued

0.51 mg 7/7/66

0.8 mg 7/31/66

maybe in AM. still effects DOP.

0.51 mg 7 Jul 66

Nothing

0.80 mg 31 Jul 66

9<sup>30</sup> am took it. Prodromal lethargy to about ~~3 pm~~ 2 pm, not really lethargy, relaxed and pleasant. Psychic ~~energization~~ energization from 2 pm, euphoric but not amphetamine-like jittery & world bright, pleasant, optimistic. Peak at 6-10 pm, with very slight wavering of lines and color enhancements. Unable to sleep at 1 am, thoughts buzz continuously. Took 3/4 gr pentobarb, Awake am groggy from pentobarb, when this cleared, again euphoric and happy - still effects of DOP?

SUBJECT

dextro-amphetamine.

BOOK NO.

DATE

To finally and subjectively assign those properties that would be called sympathomimetic - but not psychotomimetic -

10-16-66 11:50 AM. 5.0 mg.

1:30 PM.

8.0 mg more.

13 mg

Σ 13 - no effect - not even eye dilation - I worked late that night so there might have been CNS stim. - but no mental, or jittery effects.

15 mg. 11/5/77 AT3 10:42 AM - (0:00) (1:00) trace parasympathetic - that is all. at (2:00) challenge with 600 µg LSD. q.v. p. 256. (15:00) no sleep - fitful after a few hrs of hypn. - This is the only noticeable effect. other than - n.e.

SUBJECT

DMT.

DATE

before 11/1/66 - DMT up to 1.0 g p.o.s. ALFRED (friend of BORIS)

5/29/76. Constant cigarettes, a few milligrams of finely powdered Tanacetum vulgare are appropriately distributed on paper, and the free base (20 mg, 100 mg) evenly distributed and mixed. Direct heat or infrared lamp melts the base, and the sl. sticky mix is rolled into a v. tight and small diameter cigarette (4-5 mm dia.). The leaf (this is marked off) to determine the quantity taken. All experiments separated by ~ 2 hrs.

- 5 mg (inhalation) n.e.
- 15 mg (inhalation) n.e.
- 20 mg (inhal) after ~ 30 sec. a strong light-headed-ness starts - possibly some peripheral pressure. Real effect and there is a "quantitative" awareness of the measure of the intensity - no visual - no sensory distortion - just very much in its control. Max at 3 min, then rapid disappearance. Out at 7 min.
- 30 mg (inhal) within 30 sec. start. - Build up to max. (?) intensity at 2-2 1/2 min. Some yellowing of visual field - complete control given to drug - but there is nothing to do. - no eyes-closed - no imagery - the intense plateau is left at 3-4 min - still "up" but there is a clear awareness of the rate of recovery - the radius is apparent again. 8 minutes OUT.
- 20 mg + 10 + 10 + 10. Attempt to maintain the 3-4 minute effect of the 30 mg experience above by chronic reinforcement. 20 mg was inhaled - followed in a minute by 10 mg - redevelopment of the strongly intoxicated state (but not back to the "yellow" degree) and as the effect starts waning, reinforce ~ 10 mg (at 4 min) again at 8 min and here the effects seem to be a little smoothed out - next (and last) reinforcement at 13 min (10 mg) which maintained effects for a few more minutes - rapid clearance and completely out at 20 minutes. No residual effects. a completely stupid drug.

BOOK NO.

DATE

11.0 mg. — day of lunch faces, fun, nausea of ice-cream cone.

MEM (11.0 mg)

TMA 2 (11.0 mg).

10:20 AM. 11.0 mg.  
 12:00 lunch - long - many faces - down  
 to Peppers - ice-cream. - to GLADYS' lab.  
 1:12 - telephone - each side - secondary -  
 concentrate in both → w/obtain -  
 books to office (1:30) & comments -  
 1:20 → 1:30 slow - announce no this next  
 day.  
 2:00 coming out - hazy - nausea  
 in control.

10:00 AM 11.0 mg 9/26/67  
 12-1 lunch more faces, more need of  
 language control than MEM - afternoon  
 into 2 or so before the interview  
 black & white sparkle was certain to  
 be dying out.  
 At no point ~~to~~ was this more than  
 very rich threshold - but it was  
 there and a real in world.  
 As a unworld agent - this is  
 the more potent - but for  
 giggle & fun - MEM is probably  
 more effective.

at first of lunch → A = B ←  
 must try both at maybe 15 mg. maybe try will.

MEM GLADYS 12.5 mg = 10 mg TMA-2 p 112.  
 18 mg outline p 78  
 AS p 78 and above.

TMA-2 12/24/76 8 mg AS (11:20 AM)

1:30 clear threshold  
 2:20 still threshold.

threshold - 1:30 (2:30) read - some temple burn & light -  
 3:00-4:00 still read - out 5:00 - complete control  
 1:30 PM. afternoon of Pacific Overtures - possible w/agent  
 was itself bizarre - no evening problems. not a good aft.  
 details on page 229  
 details on page 229  
 details on page 229  
 see p 229, 233  
 see p 229-233

3/1/76 10 mg <sup>±</sup> 5:15 (9:00); 1:00-1:30 dinner -  
 strange evening (no stress > 1 month) stomach  
 cramp, but N. very ill. read early at 5:00  
 and slept well. <sup>above</sup> ~~below~~ threshold, that's all.

5/30/76 12+ (blowout) = 13 mg <sup>++</sup> rather effective  
 dose - more than threshold - see p 185

2/6/77 16 mg <sup>±</sup> 10:10 AM = [0:00] [1:05] at light head [2:00]  
 more noticeable - am I nitrous? [10:00] out of Eves  
 nose in! - slight if any effects.

4/2/77 20 mg <sup>+++</sup> continue on 224  
 10/6/77 25 mg <sup>+</sup> see page 224

Optically Active DDM

BOOK NO.

L-(-) DDM

DATE

L(+) DDM.

3/29/72 10<sup>30</sup> AM 0.15 mg - presses in chest (as inhibition-like) at ~5 hrs - no effects.

3/31/72 10<sup>30</sup> AM 0.15 mg NE.

4/4/72 10<sup>30</sup> AM 0.3 mg - maybe slight wiley? - no effects.

4/11/72 1<sup>30</sup> PM. 0.3 mg NE

4/14/72. 9<sup>40</sup> AM - 0.5 mg - fully stoned in a mg of DDM - lunch in BRIAN - afternoon in the throw away with CAROL - main - a trace of time shown - but otherwise full hysteria -

4/17/72 9<sup>40</sup> AM. 0.6 mg NE

5/30/72 10<sup>30</sup> AM. 1.2 mg. in middle of afternoon - extensive diarrhea - late PM - both grinding - these! absolutely no central turn-in however. NE. cal. chem. lab.

COLIN - overhearing a comment from me to JANET - She has an acute hearing, if nothing else - CAROL is loose here - Comments with DICK - the certain amount clearly the 1.1 mg of DDM & the needed stenographic pad! some mydriasis - pretty much clear by early evening.

5/4/72 11:45 AM. 1.7 mg. N.E.

8/10/72 11:45 AM. 2.0 mg (nauseobutrin) N.E. (pulse ~200 PM 5<sup>00</sup> - that's all.

8/21/72 11:30 AM. 2.6 mg - I feel that there were CNS stim - some mydriasis, some pulse and signs of blood-pressure? - teeth rattle - but still no turn on whatsoever. Hold up Nature paper for me we try in actual dynamic measurements.

ex STRAY - friend in n.e. at x mg (+) STP on next day had severe Rx in prior hashish. See comments on N-Me DOB p 208

JECT

BOOK NO.

DATE

MMDA-5

BU active, at about 30 mg, orally. modestly active - not too pleasant. - he equates qual. to MMDA-3a (late 1972)  
 Cl (per BU) 15 mg - no report.

Active at 3-5 mg orally - equivalent to 1-2 mg of DOM. See page 190 for my own essay.

March 12 1974. ATB 2.2 mg. (9.45 AM) By 12:50 light-headed - between 2 PM to 5 PM increasingly wound up (wame, intox) 5-8 - 2 martinis & dinner at Cep's - (wine, a little - taste awful) - couldn't drink much - Whisker's Trial to 11 PM - couldn't sleep 12 - 4 AM - then eat waf - AM - no hangover. Clear threshold at 2.2 (25 DOM at 1.0)

if DOM = 80 M.U.  
 DOBU = 36 M.U.

DATE

- Jan 21, 1973. ATB. 0.025 mg (12:00 noon) - N.R.
- Jan 25, 1973 ATB. 0.05 mg (6:30 AM) - N.R.
- Feb. 10, 1973 ATB. 0.10 mg (9:00 AM) - N.R.
- Feb. 21, 1973 ATB. 0.20 mg (8:00 AM) - N.E.
- March 26, 1973 ATB. 0.40 mg (9:30 AM) - N.E.
- April 27, 1973 ATB. 0.65 mg (7:45 AM) - N.E.
- May 22, 1973 ATB. 0.80 mg (8:00 AM) - N.E.
- May 29, 1973 ATB. 1.10 mg (7:45 AM) Possible twinges at ~11 AM? N.E.
- July 12, 1973 ATB. 1.4 mg (8:00 AM) Rather sweet?! After 2 glasses wine at 2 PM (late lunch) some time slowing - 3:05 AM's chapter went well 5:30 marital fun at cat for pot in greenhouse - easy intx & stop? Probably no effect, but if there is, slow meet. N.E.
- Aug 18, 1973 ATB. 1.8 mg (7:45 AM) no breakfast, no booze, no effects.
- Sept 3, 1973 ATB. 2.3 mg (11:10 AM) Careful - at 3-5 PM - rubbery teeth, uncomfortable paraesthesia - no mydriasis - no CNS effects at all - separate peripheral from central? Go slowly - No effects (central).
- Dec 26, 1973 ATB. 2.8 mg. (7:30 AM) - Nothing until ~3 PM. Some irritability - then wobbly - mydriasis - stimulant - but really quite clear - (Phone calls to Duke, Davis - but then the Dica - AD mixup) - still tight at 6 PM then wine (quite a bit) but never quite sloppy. I do believe this is peripheral stim. Was I more alert mentally? I doubt it. Let's compare the coke analysis of Fielded (almond) 3 layers flame structures. Go slowly. - Next day - depressed mood & feel most ill - did not sleep through night (dozed?).
- In retrospect - that evening I drank much wine (to get to sleep) and I was in no way drunk! - was AM a "hangover" coupled & no sleep and is DOBU an anti-alcohol?

Trials m 4-I

BOOK NO.

DATE

4-I

- July 1, 1974. 0.020 mg 1:00 PM ATS There was almost some tooth-rubby-  
at about 2:00 - beer & lunch - therefore  
no effect - go a bit slowly.
- July 4, 1974 0.040 mg 10:50 AM. ATS No Effect.
- July 11, 1974 0.065 mg. 8:35 AM ATS No Effect.
- Aug 8, 1974 0.10 mg 8:30 AM AB. General stimulation in P.M., but  
heavy exposure to I<sub>2</sub> - i.e. no effect.
- Sept 7, 1974 0.175 mg 10:00 AM ATS no effects
- January 10, 1975 0.25 mg 9:55 AM ATS no effects.
- + Jan 28, 1975 0.40 mg. 10:15 AM ATS. 2:30 (12:45 PM) very lightly spaced  
reaction 5:30 still lightly spaced - getting a lot done  
5:45 (4:00 PM) a bit more! a trace of tooth-rubby  
10:45 (9 PM) try to soften & burp - no intake - ~~no~~ sleep. OK. cat naps at  
last - repeat old CIA dream - AM - OK - no forced by for lack of sleep. Is  
this a def that is a sense blockade? - note ← re-2 centom of Jan 11, 1975;  
the no-burp effect - the no-sleep effect?
- + April 29, 1975 0.60 mg 9:30 AM ATS 3:00 nice spaced light-headedness -  
clear threshold. 4:00 still light-headed. time moving slowly.  
5:00 (2:30 on disk) still there - slow tour of farm - sad reminiscences -  
at lower house (reaching pleasures now gone) - Joe's earlier days (high-  
school teen - "bit we a few" - I see the area - farm - getting old around me -  
I just can't do it all, and no-one else cares. Will I be allowed to be here  
when I am older. 7:00 Things seem to be becoming back-to-present.
- ± Aug 18, 1976 0.40 mg, 16 µCi <sup>131</sup>I. 11:35 AM. could kid myself at 3:00 PM. skinnier - n.e.

~ April 1975 7.0 mg ATS Third fry: 10:AM 0:00 (10:10 in kitchen clock)

1:15 light-head 1:40 pleasant high - I can explain earlier  
contradiction - I was looking for the wrong thing.

2:10 full pleasure of everything - 3:00 - gone, largely.

Oct 24 1976 8.0 mg ATS (2:10 PM to 0:00) (0:50) 1<sup>st</sup> hit (1:05) slight (1:10) very gradual  
no eye-throw (1:30) up to 10-20% "window" effect of MDMA - slight edge effect less.

(2:05) substantially out - little effect overall - yesterday was 100 mg MDMA - perhaps  
new tolerance?

DATE

See earlier notes re. 1964-5 epts on page 94.

2-C-DM!

yes - 10.25M  
Nov. 26, 74 -  
2mg - No Effects

- Nov 26 1974 - One trial at, I believe, 2 mg was made, in late Nov or early Dec 1974 - cannot find notes.
- Dec 21 1974 12:00M ATS 2.5mg no effects.
- Dec 26 1974 2:15PM ATS 4.5mg no effects.
- ± Jan 3, 1975 9:15AM ATS 6.0mg - a bit of threshold temporal hump at 1-1/2 hrs - nothing at 3 hrs.
- Jan 11, 1975 9:05AM ATS 8.0mg no effects - note 4I 1/10/75 4Br2c 1/8/75 tachyphyl?
- ± Jan 24, 1975 10:50 AM ATS 8.0mg after > 1 week drug free - slight coming on at 11:45 - certainly clear by 1:00 - not noticeably different than the N.E. of 1/11/75. advance to 10 mg without - then with ~15 hr preheat @ 4-I.
- ± February 6, 1975 9:55AM ATS 10. mg slight teeth, slight throat dryness at 12:30 - stim. c tongue - certainly out at 2:00 PM. No.?
- ± February 16, 1975 10:00 AM ATS 12 mg: at 11:00 AM (1hr) a wee bit - if this is all, I am disappointed that it was only 12 mg. Very slight effect from 1-2 hrs. that is all.
- ± February 23 1975 8:00 AM ATS 15mg in an hour or so - a slight effect - that's all.
- ± August 19 1975 11:00 AM ATS 15 mg - slight effects, 1-2 hrs.
- ± Dec 15, 1975 10:30AM ATS 15 mg - slight if any effects 1 1/2 - 2 hrs.
- + Nov 26, 1976 9:40 AM ATS - 20 mg. - at [0.50] maybe slightest effects. [1:30] I seem to be a little offkey - I can focus on whatever I wish to. [2:00] decide to focus on chemistry - and that pretty much ends it all. Substantially no effect.
- date - 1976? Gray 15 mg and 20 mg - few hrs - agree @ bit c H letter 1/4/77
- ++ 6/6/77 9:03 AM [0:00] [1:40 - 1:00] develops to a somewhat brittle effect [2:00] + or ++ stored - [25mg?] sensitive - not nearly the fun of MDMA - [5:00] out - ++ OK. I do not find this useful or intriguing - shallow & brittle.
- + 5/18/78 7:00 AM [0:00] 20 mg [0:40] something very subtle starts (1:00) a subtle + one. Basically nice - I wish it were more intense [1:20] very real + - intense ej!! [1:35] between + & ++ but I can do anything I wish to. So, chop weeds - drift back inward fully.

DATE

- June ~ 4 (Thursday) 1975 8:45 AM. 1.0 mg no effects.
- ± June ~ 10 (Tuesday) '75 10:20 AM. 1.8 mg Visited AO at Dow - bridge at ~ 1200 with noticeable tremor - hand shakes - poor bridge. dilation? prob. no effects.
- June ~ 28 (Sat.) 1975 10:10 AM 2.5 mg slight teeth-rubbing - no effects.
- + July ~ 17 (Wed) '75 10:40 AM 3.2 mg real threshold - or a bit more!
- real time  
 :20 mild light-headed - nice  
 :30 light intox. very nice - look forward to more.
- :50 walked out to mail. gentle sparkle and compelling amazement at my hands - quite apart from me - sensory awareness? - a warm, friendly, allied world about me.
- :30 signs of drooping  
 :35 31 - magnificent -  
 :45 (12:25 PM) definitely drooping off - slight residual tooth-rub.
- :55 drove well - completely out.
- ++ July 30 1975 (Wed) AB. 9:30 AM. 4.0 mg. real time :00 real effects.
- :25 Knees a bit wobbly - something is happening -  
 :35 organ-like feeling on face, in eyes, at temples - erotic!  
 :55 spaced - completely delightful - some light flickers (above base line of sight) - enjoy play w words. light light in eye etc
- 1:10 Heavy flamed - strong startle Rx - MDMA-2 info! 209 = 209 am I past peak?
- 3:00 completely out.
- + August 27 1975 10:15 AM. 5.0 mg :00
- :15 light of head? dry of nose? psychosomatic  
 :20 slight muscular shakes  
 :23 on it comes - nice  
 :30 full. slight dilation  
 :50 whatever I want to attend to, is fully amplified. I keep moving about with my eyes, ears, senses, to see where they will alight. Music, a symphony from a 3" speaker is artificial - the piano (real) is excellent
- :15 maybe down a bit. JOE came, wanted 50 ml H<sub>2</sub>O - handled well. :200 substantially out.
- ++ Sept 3 1975 9:30 AM 6.0 mg. - notes on page 198 continued p. 218

DATE

DIPT.

- ± July 9, 1975. ATS - 10:30 AM. 10.0mg Threshold - clear dilation -  
much tooth rubby - 1 hr ↑ 2.5 hr ↓
- + August 3, 1975 ATS 9:50 AM. 14.0 mg - More than threshold -  
0:30 teeth rubby - some effect.  
0:50 not light head, but light body. from here to about 1:30 a  
strange trip = my mother's writings - mom - son - dialoq - lunch  
finally at 12:00 and this. 2:10 still a little unreal -  
not the 5-022 erotic - but some real effect. Up again, but slowly.
- BU report late 1972 - 25ug orally → visual change in films, not color - 1 hr  
of it is like acid, and in three hours it is over.

- ++ Nov. 9, 1976 ATS 4<sup>00</sup> PM. 18mg [0:00]. Mild effects noted at [0:00-1:20] easy extream.  
[1:30-2:30]. remarkable changes in sounds heard. 1515's voice is bass - like a  
cold - my ears = sl. pressure as if the ~~ear~~ eust. tubes clogged but they ain't. Radio voice  
are all low - music out of key. Piano sounds like a bar-room disaster. Cannot  
count on auditory feedback to play. The telephone sounds partly underwater.  
No - sounds at 2 levels. [3:40] I think music pretty much normal again -  
virtually no other effects. certainly clear at (6:00) - probably much earlier.
- ++ April 7, 1977 ATS 9<sup>20</sup> AM 24 mg [0:00] - (0:20) saw slight change [0:35] first signs of  
pitch change on radio - hard writing very poor [0:43] in lab - music deteriorating - I  
cannot measure rate of drug effect - as there is absolutely no window [0:55]  
absolute pitch down a major third - chord on piano sounds out of tune, quite  
flat - and when struck, tends to drop and then waver in pitch. terrible  
[1:30] gone! - music extraordinarily and unbelievable - [2:00] middle notes -  
(G above C to E above C above C) have glaucospeid after-sounds - nowhere there  
here - and on to [3:00] when there is some straining out - were the other senses  
in any way affected. [5:00] sounds returning - in a great environment there are  
absolutely no effects of any kind. If I were deaf this would have been an  
inactive dose. How many other drugs have I given a (-) to because I did  
not know where to look! [7:20] - hearing normal. pains back in time. ++

 - 12/3/75 12:25 PM ATB 400 µg wait a few days - scale up slowly N.E.  
 ± 12/7/75 11:15 AM ATB 550 µg [1:45] slight light-headedness which lunch  
 quitted. [2:00]-[2:30] occasional tachycardia - probably N.E.  
 - 12/10/75 10:45 AM ATB 700 µg no effect.  
 - 1/4/76 10:30 AM ATB 1.1 mg no effects.  
 + 1/11/76 10:45 AM ATB 1.7 mg [1:30] (12:15) distinctly spacy - interesting - go to  
 lunch. [3:15]-[4:15] with rubbery threshold? [5:00] nothing.  
 + 1/23/76 10:00 AM ATB 2.5 mg real threshold. 11:30 on [1:30] continuous threshold  
 intoxication - on into afternoon - no difficulty with the handling  
 on new chemical ideas - finally at [5:30] only a vesicular warmth  
 + 2/11/76 11:00 AM ATB 3.2 mg completely real threshold [1:15] (12:15) noted  
 1/2 effects. [3:00]-[4:00] happy manic intoxication - clear or  
 virtually clear at 6 PM [6:00] - given active dose 5-10 mg.  
 + 2/21/76 11:00 AM ATB 4.0 mg very clear (and intense!) threshold. No detail  
 of intox can be noted. Not really pleasurable, not prefrontal - w  
 senses - no time. But clear thresh from [1:15] to about [5:00].  
 ++ 7/2/76 10:50 AM ATB 5.0 mg extremely effective, purely psychiatric intox.  
 [0:50] warming of lower legs [1:35] warm all over - effects on usually.  
 [1:50] intense - no sense modality changes! - not yet anyway -  
 [2:30]-[5:10] intense intellectual skin → <sup>ALERT</sup> report - 14 pages of  
 notes: well out by [6:00] - good appetite - emphasis & design afternoon.

X-O Dimethyl Serotonin

- May 4 1976 10:00 AM ATS 0.1 mg n.e.
- ± May 8 1976 4:25 PM. ATS 0.2 mg something starchy - ~8PM? no. n.e.
- May 11 1976 10:10 AM ATS 0.4 mg n.e.
- May 19 1976 10:40 AM ATS 0.7 mg n.e.
- + June 1 1976 10:15 AM ATS 1.0 mg threshold !!! First afferent at 11:15 - 11:30  
a very light unworldliness - on through Lori's seminar in the old clinic bldg (12-2) with a completely spacey afternoon. Still odd at 3:00 PM [4:45] - quite bloated, little urination. In PM (10 PM) clearly out but a fragile frontal headache - still little urine.
- + June 13 1976 10:40 AM ATS 1.3 mg [1:00 - 1:20] (1:10) some stomach cramps, alternately ± slight light head. [3:00] nicely stoned - no questions - drift on through afternoon - water grabs - no profound things. no headache - urine seemed ok. Not as much effect as the 1.0 mg dose? This is quite long-lived.
- ± Aug. 7, 1976 11:15 AM ATS 1.3 mg - perhaps slightest threshold during afternoon. n.e.
- Aug 25 1976 1:00 PM ATS 2.0 mg - (2 hrs following my 5-outs DMT study) - (2:00) ej + 2,3 after stools - (2:30) believed something - almost like residue of 5-outs-DMT. [3:00 - 4:00] heavy diarrhea - slight effect in sun.
- + Sept 1, 1976 11:00 AM. ATS 2.3 mg - to verify threshold away from 5-outs DMT. [0:00] [1:25] - no question - really tuning in [2:30] still no question. - but what is to be seen [3:00] - thorough diarrhea - clearly (mentally) an ASC waiting for some sensory, or perceptual, or conceptual event to occur.  
[3:30] a little of the DMT yellow-filter.  
[5:30] clearing - in retrospect, I don't know what it was all about - it was as if I was in a state of preparedness (≡ a plate of skulls open) waiting to provide attention to whatever was to be introduced into it. But there was no inculum. I didn't contribute my share. Is this why DMT is so many things to so many people? A good argument for threshold being a better measure of drug potency than full dose.  
Had a slight fragile (hang-over-like) headache in next AM - gone by noon.
- +++ Sept 10, 1976 10:45 AM. 3.0 mg Full active dose - see page 196 for details.

Studies continued on p. 252

SUBJECT Qualitative Description - TMA-2

BOOK NO.

DATE

12mg + 1mg = 13mg TMA-2 Sunday May 30, 1976: 11:40 = 0:00 - no ETOH for 5 months -

1:10 Onset of first threshold effects - slight nausea - probably coincidence - but numbness of 4-5<sup>th</sup> fingers of left hand (see 1<sup>st</sup> trip!). But these fingers have been troublesome (left hand too) and are often asleep on awaking in mornings -

3:00 Really pleasant, with native euphoria. Sat behind lab on steps in the sun how often I have been apprehensive in a drug essay that some emergency or other crisis might occur requiring some logical decision, and would I be able to respond adequately - but I have realized that if a fire, strange person, insect - were to threaten - then, and only then, do I need to consider the situation - so - until then enjoy - I did.

This was in especial contrast to yesterday's study in DMT - perhaps I was so attentive to the possibility of some falling-down-stoned reborn, that I neglected to be receptive to a true altered state of consciousness - without perceptual change, without perturbations inherent, without the LSD impact or the DMT physical aspects.

I am completely convinced I would be able to handle 16 mg by myself and this as a full dose would quite accurately be 20 M.V. (with mevacline at 300 mg base - say 320 mg = exactly 20 M.V.). However, I would not care to pretend to be responding normally to a demanding world.

5:20 still with it. Tried to elicit visual distortion by going (1<sup>st</sup> time) into Cort plus inputs in W. Creek. No such induction. Did a rather bad job of driving however. Had to pretend distractions. To "All The Presidents Men" - with no clear visual distortion. I MUST REMEMBER - an ASC need not have visual distortion as a symptom!

8:00 Drove to Berkeley Farms for dinner w/ D & her mother. Still odd driving which D commented on (what is the matter with you?). I had forgotten where the place was! - clearly emerging - on into evening without further events except a light sweatiness 10:00 - 12:00. Difficulty (mental disturbance) in going to sleep.

This is a clear ASC process - perhaps valuable to describe (display) to a subject what this all is - without some annoyed sensory modality demanding attention by misbehaving. Intensely day!! -

BOOK NO. \_\_\_\_\_  
DATE \_\_\_\_\_

- 6/3/76 10:27 AM ATS 1.5 mg. n.c.
- ± 6/8/76 11:55 AM ATS 3.0 mg clear threshold - noted at [0:30] - slight shiv tingling - I think there will be visual events at somewhat higher doses - slow drop-off through afternoon - clear by [4:00?]. Proceed with interest.
- ± 8/10/76 11:30 AM ATS 4.3 mg [0:30] effects coming on. tingles, yawning. [1:00] - [2:00] very much like being with people - Patti at bank - search not Jackie - she had gone south again - stacks of library cold - waste of time (got a lot done) - still aware at [3:00] but all clears up promptly. Proceed with interest.
- + 1/14/77 5:10 PM Jan 14. Friday 6.6 mg ATS [0:40] 1<sup>st</sup> awareness - clear window effect - [1:00] eat full dinner - effects develop during the meal! Up to ~20% window - some hints of animal faces in the fork-drops bones - No movement. [1:40] nothing flows, but it wouldn't take much effort. [2:00] dropping quickly - only the slightest effects left. [2:20] out [2:40] out. The forth-coming 10 mg experiment should be a delight. But allow 'k day free for it. I would be completely unable to distinguish this, at 6.6 mg, from MDMA at 50 mg.
- + 1/20/77 9:45 AM Jan 20 10.2 mg Sunday Psoc, ATS, first class at [0:27] driving up 5% to clear a little window - not much more until [0:45] - coming on well - [1:00] comfortable in security of club library [1:45] - I can make the world move a little - but I can do that without drug too. These little effects drift away over next couple of hrs.
- ++ 1/21/77 10:30 AM 10 mg Dave effects volunteered at just [0:30] (felt before) - overall ~80% of the 300 mg mescaline effect. - concurrent c my '4C mescaline #1.
- +++ 4/27/77 9:30 AM 15 mg [0:00] [0:10] 1<sup>st</sup> notice - "early-warning" system - I stay flat at this first level to about [0:25] - then it builds up. [0:27] I am awfully glad I have MDMA window knowledge - what is happening here to me, appears to be what others get on MDMA. [0:28] visual distortion - I can't find the cap to the pen - must I keep writing forever? At this point I couldn't drive - I couldn't even write! [0:36] - [0:57] wild development. Furniture in office moves up & down [1:00] the down c eyes closed - This is where it is. eyes closed → all wild imagery - still c eyes open if there is no visual input. a dark room or a fire in the fireplace in the middle of the night c no other input would be dramatic. eyes closed → body image in front of fire, and I can synthesize 2x removed a complete hallucination [1:45] try again. already passed the peak via good. [2:00] to mail - this is a night-time drug - some movement, but daylight washes everything out. Warnings got it the proper way. [3:00] pretty much out - muscles OK - timing OK. would I try a new experiment, say c LSD - OK but c reservations - [4:00] completely drunk - no reservations. I had peaked within the 1<sup>st</sup> hour - and was definitely on my way down in the 2<sup>nd</sup> hr. The experiment above, at 1/21/77 - may have been unfair to Dave probably distorted his timing terribly.

28-77 interaction xpt. 10/8 mg night colored forms -

SUBJECT Qualitative effects of TMA-6. (ex page 150)

DATE

June 15, 1976 - 16 mg TMA-6 - 3:00 PM 2 hrs. P.P. - time 0:00 1:30 maybe something.

2:00 still uncertain - something developing?

2:30 color interpretation wild - orange = origin - Red may be birth (blood, sunrise) - but orange precedes red - phytylenes → amidebanis, brilliant chemicals in lab - outside world all blues and greens - olive - but already born (and certainly already long ago conceived) - and the earth browns and such are almost dead already. 3:30 - sit behind lab - most pleasant mental wandering - into porch & cat - lie in wotted sun so that leaf-shadow in wind flicks eyes - eyes-closed generation of light - color patterns weak. 4:30 eat dinner - just fruit salad - but - 'not are oranges!' (luckily I didn't think of the Spanish translation of AC. (a) = orange. 5:30 lum and abner - just lightly stoned and washed I had paid more attention to the earlier effects - it is slipping. 6:00-7:00 practice (piano) vigorously - pretty much gone. 7:20 still a little teeth-wibly.

TMA-6

2,4,6 Trimethoxy<sup>phenyl</sup>propylamine

Fredo's notes from  
his file. 1966-67.

11.7 mg 10 Feb 66 4:00 pm (5 mg Ritalin at 3:00 pm - forgot until

had taken the TMA-6)

5:30-7:30 pm (1 + 3 hrs) felt slight distortions of time.

and space, some enhanced emotional affect. No color enhancement.

Threshold only, and may have been enhanced by Ritalin.

13.3 mg 1 Mar 66 5:00 pm

½ - 1 hr slight prodromal effects - queasy, vertigo

3-5 hr Peak of effect. Some perceptual distortion, color enhancement, but not much. A little difficulty with balance

at first when dancing (at dance class), later cleared and was able  
 exercised strenuously, until stopped by absolute breathlessness,  
 then stopped, felt heart pounding (not unusual) and a cute  
 hot flush of sweating (not unusual either except in degree).

Emotional affect seemed to be nil. Abdominal distress at 11<sup>00</sup> pm  
 with constipation fell and immediately by diameter; this could  
 have been due to washroom encounter with Mescaline extract  
 (probably) for dinner. Able to go to sleep at 12<sup>00</sup> pm  
 without back trouble; some eyes closed imagery at this time (2-3 hrs)  
 (noted some very bright, somewhat red and white). Result to  
 morning

26.0 mg 31 Jan 66<sup>07?</sup> 5<sup>00</sup> pm Peak 8-9 pm (3-4 hrs) Some physical symptoms,  
 things appeared to move just a little. Color enhancement strong.

## TMA-6 cont

26.0 mg - Emotional affect strong. Dance class 8-9<sup>30</sup>; initially awkward,  
 balance poor, but as I warmed up had no difficulty, felt very  
 free and expressive. Some lower bowel cramps before and after  
 dance class, none during; <sup>felt need</sup> ~~compulsion~~ to defecate, could not, but  
 release of some gas relieved this sometimes. Dinner at 7<sup>00</sup>, then  
 effects were under way, was very hungry and ate well (whereas  
 mescaline suppresses appetite). Went to sleep easily at 12<sup>00</sup> pm.  
 From 8 to 11 pm had some brilliant but not too well-structured  
 eyes-closed images, jewels, lights, silver + gold. Equivalent to  
 250-300 mg mescaline, 35 µg LSD.

29 June 1970

3<sup>30</sup> pm 5 mg Rv4h5<sup>30</sup> - felt happy smiling, slight stimulation.11<sup>30</sup> - Somehow felt more spontaneous - did things instead of just thinking about doing it. What I did was me - but somehow more me.

Others in family agreed - I was less inhibited, less crabby.

4 days later - It lasted about two days - then back to nervous cranky self.

It seemed like a beautiful drug with all the peaceful, calming effects of MDA - but at no time did I ever feel high or stoned.

3 July 70

9:30 AM 8 mg Rv4h

12:30 PM Strange state - introspective, hyper-emotional when reading &amp; listening to music

1-4 pm - 3 hr nap

after - some sort of calmness

4 July - " " "

5 July - Very depressed ( & looking back there seemed to be a depression 2 days after 1<sup>st</sup> dose

6 " - still depressed

7 " - slightly "

8 " - OK?

9 " - OK - Today is 1<sup>st</sup> day I've really felt together & able to work.

9 July -

All in all - very interesting - but I don't think I'd do it again for awhile. - along while.

The main effects seemed to last 2 days - a calmness & peace. I could handle it all without being upset - no getting so short temper. The two days are not all quite at the real level - there is a greater stimulation for first 6-10 hrs. Altogether - Very nice

But - there did seem to be a severe depression - esp. after the second dose. I know it's very hard to separate out causes - & I am <sup>concerned</sup> ~~upset~~ about my work etc - but I do feel the drug greatly intensified the depressed feelings - there would not have been a true depression without it. Partly it could be that I've taken a fair amount of amphetamine & nitalin - I've noticed the rebound depression (incl. ~~for~~ actual pain) ~~has~~ from them has gotten worse lately - so maybe it would not be a problem in a more long-term use.

Aleph - 2

- 8/19/76 11:45 AM ATS 0.1 mg no effects.
- 8/23/76 10:00 AM ATS 0.3 mg no effects.
- 8/28/76 11:00 AM ATS 0.6 mg no effects.
- 9/2/76 11:20 AM ATS 1.0 mg no effects.
- ± 9/22/76 4:45 PM ATS 1.6 mg - at [1:30] maybe effects, at [2:30] there is some sort of threshold (in French class) - not disruptive but believable - to bed although completely alert (at [7:00]) - no sleep but at the time logical self-images for 3 more hours. Some sleep eventually. Next day OK - Next night sound sleep. Threshold?
- + 10/31/76 10 AM. ATS 2.0 mg - first hints at [1:20] - very subtle - no minkows - all afternoon lunch [2:00], drive to library at Berkeley [3:00], even into recital at club [6:00] an unremarkable - i color effects at the edges - people looked strange - (1<sup>st</sup> time in months, I am reminded of mescaline. True threshold of a subtle drug.
- + 11/6/76 11:20 AM. ATS - 3.0 mg. [0:00] - [1:10] first possible effect - lunch - not too hungry. [2:00] still running threshold [2:20] diarrhea - movement of rug? colors in towel? [4:20] each parasthesia - I am under the interesting cloud of some drug effect, but at a very mild level - Things will happen at the next dose level I am sure.
- 11/21/76 9:45 AM ATS. 5.0 mg completely effective level. See page 205

all data now combined on 205

Additional data on 5-OCH<sub>3</sub>-DMT

- (3 mg) March 15, 1977 - ATS, Dave & Edward set within a minute, except for Edward quite a bit longer. Spectrum i Dave & ATS similar, and similar to p 195 notes. Edward - eyes - closed experiences of Heimchen + Calif beach at same time - convincing demonstration of 2 separate levels of existence - After 10 min, second experiment  $\approx$  to 1st. Surprising effect in favor for ~ 20 min - into restaurant - unwilling to go ahead alone - and no before-dinner drink. No residue.
- (10 mg) April 1, 1977 - ATS - as much as possible taken from a 20 mg cigarette - effects before 1 min - max at ~ 2-3 min - drop nearly out but not completely, by 6 min. - Smith, stony - an ASC with no sensory or interpretive overtones.
- (10 mg) Feb 11, 1978 - ATS consumption of 25 mg in three consecutive administrations (from a 25 mg Tanager cigarette. Stood within a minute - largely recovered within a couple of more minutes. All the times < 20 minutes.
- 1 mg in PMSO - left trip 7/24/78 11:50 PM - n.e.

BOOK NO.

5-0243 DMT

DATE

August 25 1976. Consumed 3 cigarettes - hand rolled on Taraxacum vulgare - One at 10 mg (base) scored at 1 mg units, two at 20 mg base, scored at 5 mg units. Under heat lamp to melt base, then tightly rolled. All assays by inhalation.

- 1.0 mg some slight pulse ↑ - otherwise n.e.
- 2.0 mg 10 seconds following, quite aware. [0:00:25] more aware yet and increasing to [0:02] - uncharacteristic intensity of cws attention, - urge to rapid movement - no sense change - no pulse - little eye dilation  
[0:02.5] slacker - [0:05] out.
- 2.0 mg absent [0:00 - 0:00.5] real at [0:01] - slight shakes - little if any mydriasis. out at [0:03]
- 3 mg (+2) absent [0:00 - 0:00.5] - on before [0:01] - quite intense at [0:02], slacker by [0:03] - at [0:04] reinforce  $\bar{e} + 2$  mg which is noticeable in another minute. slacker at [0:07] clear the body for an hour before continuing.
- 6 mg absent [0:00 - 0:00.5] effects noted before [0:01]  
[0:01:15] stoned - not really light head, but head feels close to the lower parts of the body - close to ground - knees weak - distinct shakes.  
[0:02 - 0:02:20] peak effect - quite intense - not quite the max of DMT at 30 mg and no sensory close-out -  
[0:03] peaked - am sliding back  
[0:04] quite nauseated - glad I hadn't eaten (4 hrs)  
[0:05] clearing quickly - not as exactly defined as DMT  
[0:07] 90% out - fast recovery  
[0:09] completely clear. perhaps a slight residual mydriasis.

Overall comparison to DMT. more potent (6 mg  $\cong$  30 mg?)  
slightly faster (2-2.5 min max, out at ~7 vs.

3 min max, out at ~10 min

← This drug, as largely with DMT - is a simple, stoning, drug - with no sensory contribution, no intellectual contribution. perhaps desirable for providing a subject the vocabulary of ASC, so that with interesting and constructive drugs, these effects will be familiar and thus not distracting.

DATE

(cross ref p784)

September 10, 1976 10:45 AM [0:00] 30 mg in water.

- [0:45] warm flushing - nausea - oh I wish the physical would be done with.
- [1:00] some dilation - I am uncertain if there are some CVS, or just fighting nausea.
- [1:15] active vomiting (mild) releases nausea - and there are virtually no symptoms.
- [2:00] building into wild ASC (ejeret) eyes closed - roly clouds and strangely interpreted imagery - try eating apple - not sure of stomach stability.
- [2:45] into zombie period - well is a bit Frankesteinish - piano keys unreal - type written keys unreal - music & text that comes out has little bearing on ~~my~~ my intention. The most fun was writing with the power off - in inhibitions - no record - tried a bit  $\bar{c}$  power on - this came out.

what an aliel keyboard - what will it produce?

|        |       |       |       |             |        |
|--------|-------|-------|-------|-------------|--------|
| anilan | alina | anein | alein | alean       | ailean |
| alian  | alien |       | wow   | wowowowowow |        |

- [3:15] Lion's face (on chair) - many things - cheeks become boxing gloves - mouth talks but no words are evident - entertaining - but not profound.
- [3:45] So much mileage from just 3 mg of  $\text{CH}_2\text{NO}$ . - Obviously it is my own energy pool that has been tapped.
- [3:50] Old friend diarrhea again - modest - just symbolic. All through the last 2 hrs - in addition to the interpretive changes, there were mild visual distortions - things tended to flow - not bothersome - but I know I couldn't drive a car. Here was a marvelous chemical gestalt - reasoning from o-hydroxy benzylalcohol  $\text{R}-\bar{c}-\text{CO}^- \rightarrow$  benzyl cyanide, why not dehydrate to  $(\text{C}_6\text{H}_5)_2\text{C}=\text{CO}+\text{OH}$ , then reduction 1,6  $\rightarrow$  p-OH allylbenzene and 1,8  $\rightarrow$  p-OH propylbenzene - then - if reduction goes from methoxy group, a compound such as normetanephrin would  $\rightarrow$  2-carbon MDA (p-OH reduced off at expense of epinephol becoming a methylenedioxy. Phoned Jill... he was cursed.
- [4:35] Quickly mending
- [5:00] I could drive to Lafayette now without trouble - visually things still wobble but the physical zombie is not there anymore. I can ignore the crawling.
- [10:00] still some dilation, teeth are rubbery, hypoxia. There is still some body poisoning present.
- [12:00] attempt sleep - not too satisfactory - restless - strange mental interjections.
- [24:00] (next AM) clear - no residues.

This is probably the most potent indole psychedelic yet measured, at least via oral route. Any higher dose would require baby-sitting.

SUBJECT

9/15/76 10:37 AM ATS 0.5 mg - Gisela thought I was a little hyperactive in afternoon (2-5) and I was certainly a bit mopey, & very much entertained. Probably no effect.

9/18/76 11:00 AM ATS 1.0 mg, no effects whatsoever - n.e.

9/21/76 10:40 AM ATS 1.6 mg tingle? [1:40] - n.e.

9/25/76 10:45 AM ATS 2.2 mg funny? [2:30] - n.e.

9/29/76 10:00 AM ATS 3.0 mg [2:30] fleeting light-headed - 5 sec! [3:30] slight power game. thresh? n.e.?

10/3/76 11:00 AM ATS 4.0 mg - all through afternoon, I could believe a shallow threshold - tooth-rubby - some intentional parasthesia & no sleeping problems. but. n.e.

10/6/76 11:00 AM ATS 6.0 mg - a most a shallow threshold - no more. Conceivable chemical non-specific tolerance? yesterday 10/5/76 - 100mg of MDMA - but that was completely repaired at 1:00 in PM. I cannot confirm CV?! - n.e. p.s. attempt sleep at 12:00 - mild difficulty - then restful.

11/2/76 9:50 AM 10.0 mg ATS. [1:20] into some threshold but none of the MDMA-type window [2:30] - I've found it - morphine! [3:00] complete central analgesia - experiment - with sterile needle - pierce skin pinch on left arm - little bother except for the needle emergency (skin resistance) - little bleeding. Multiple pin-pricks on skin over thumb abductor - no feeling. Cup of boiling water elicited shock response reflex, but once that was over with, no pain - intellectual awareness of blistering keeps me from silly experiments. I feel lucky that my judgement is OK to keep from getting in to self-harm trouble [4:00] perhaps some repair [5:00] still not complete. [10:00] Driver in city - Jill. - some tooth-rubby - so there are still some physical effects. [12:00] burning irritation at the pin-prick area - so ~~folly~~ feeling is back - Obviously long lasting analgesia. No sleep problems at [15:00].
